1. Kenwood R5000 S-Meter & computer interface?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-01 00:00:00 UTC
From: mirov@Eng.Sun.COM
Message-ID: <4r94db$lo0@engnews2.Eng.Sun.COM>
Source record: 198564

Kenwood's R5000 receiver has as an option a serial port to allow control by a computer. It seems that they did not think that reading the S-Meter from the computer would be a valuable feature...

I'd like to modify my receiver to support this new function. Internally there is a 4052 A/D converter, and some of the analog inputs don't seem to be used for anything really important.

Has anyone out there done this sort of modification, and if so would you be willing to share what you've learned.

If not I'll reverse-engineer the prom and create a new serial port command to support remote S-Meter reading.

-Russ Mirov (mirov@eng.sun.com)

>
>Any idea how they got around that one?

The no user programming requirement is relatively new. In the days
of crystal control, no one thought of it. It was after the advent
of synthesized land mobile rigs that this started to be a problem.
So the FCC revised the Type Acceptance criteria to prevent user
programming. Radios produced before the rules change may still
be user programable, as the requirement was not made retroactive.

3. Re: DSP filters -- which one to purchase ???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-01 00:00:00 UTC
From: Tony Vanacore <nts@popd.ix.netcom.com>
Message-ID: <4r95hc$q82@dfw-ixnews3.ix.netcom.com>
Source record: 198566

Joe, I talked to many hams regarding their thoughts on the DSP they were using and settled on the NIR12.

I was able to purchase one used at a good price at Dayton and am very pleased with the performance - especially on CW. I found the manual to be excellent and the construction above average.

I can recommend it highly, but would add a word of caution. A DSP cannot help if the signal is below the receiver noise thershold - it cannot enhance what is not there. For reducing white noise and interference, it works great.

Hope this helps.

More than "irregular", it's ILLEGAL! Check the FCC regulations regarding
encryption on the amatuer bands.

There was a fairly extensive discussion of this on moon.net a while back. Check www.nitehawk.com/rasmit/dsp50.html for links to an archive of the moon.net discussion and other DSP information.

>Does anyone have some recommendations on which one is best
>from a cw-op perspective? I assume CW is easier to signal-
>process than phone, so, I guess a less expensive unit would
>suffice for my type of operation.

The DSP-9+ and the NIR-12 are generally well liked. However, one user raved about the MFJ-784. The ability to tune the bandpass continously, as well as continously changing the filter width, appears to be a real benefit for very weak signal detection, IE you can smoothly tune across your receiver's 500 Hz passband with a 10 Hz filter looking for a really weak one, then open the filter to 100 Hz to copy his CW. The other units use discrete steps if they allow this feature at all.

From: TRon Davis <rond@intellect.com>
Message-ID: <01bb6780.fc330ee0$81629dcc@dell100>
Source record: 198569

I heard someone on the air mention that they bought a very slick HT Holder at the recent Ocean Shores, OR hamfest. Since I only own HTs - I could really use something to hold them upright and steady with mic cords pulling on them and antennas attached. Does anyone know of a source for the HT holders??

Cheers

>Receiver Pre-selector, AF/RF gain? What does the Relative Power meter
>mean? Also, I hooked the transmitter to a frequency counter, and the
>tuning scale reads 15 KHz too high, but I can tune the Tech+/Novice CW
>bands on 40 and 15 meters. Is there any way to adjust this?

Wide/narrow switches an audio CW filter in (narrow) or out (wide).
Loading is a variable capacitor used to adjust transmitter loading into
the antenna. Peak the output power using this control and the RF meter.
Receiver pre-selector: Peak the incoming signal strength using this
control (no "S" meter, so do it by ear, works fine).
AF gain is volume, RF gain adjusts receiver sensitivity (use this to
knock down really strong signals so they don't overload the receiver)
The relative power meter gives a RELATIVE (un-calibrated) indication of
how much power the transmitter is putting out. I repeat, this is only
a RELATIVE indication. Tune for maximum indication and forget it.

The VFO calibration can be adjusted. You will need the manual to get
instructions. Should be easy to obtain, put a post on rec.radio.swap
and ask for a copy of the manual. There are thousands of HW-8s out
there somewhere...

>Any suggestions for a 40M/15M antenna which doesn't take up too much
>space? I have a townhouse, and a >100ft dipole isn't practical!

A 40m/15m dipole would be about 66 feet long end-to-end. Feed it with
450 Ohm ladder line and a transmatch, and you can use it on 40/20/15/10
(but stay off 20m if you're not General or higher!).

your area. Please contact your local or long distance phone company to determine the most economical rate in your area, including the possibility
of an extended area calling plan. The AT&T Customer Care Center will not be able to determine your local or long distance rates.

Why Two Monthly Charges?

So you picked a price plan with a monthly charge - $19.95, $24.95, or $4.95. On this first bill only, you will see your monthly charge billed twice; one charge for your first month of service and one charge in advance for next month's service. We do bill in advance. So, on next month's statement, you will see just one monthly plan charge for service during the following month.

Reading Your Statement

You will find help reading this statement in the "Customer Service" section of the AT&T WorldNet Service web pages. To access this explanation, exit from E-mail and log on to AT&T WorldNet Service. Click on "Customer Service", then on "Accounts and Billing." On this page is the section "Understanding Your Statement," which explains each section of the statement.

Hi Derrick-

I have a Heil Proset with the HC-4 element in it, and while I don't do a lot of phone operation, I have asked other ops to listen and compare it with three Electrovoice mics, three Astatic mics, a Collins mic (Turner), and an Icom mic, and I have been told by everyone who has helped me with the comparison that the Heil blows the others away in intelligibility.

I guess that says it all, far as I can tell....<g>

I'd buy it again in a heartbeat.

I use the Proset (HC5) nd find the Audio very good for TX. A very
good DX performance without copromising local working audio too much.
The phones are superb! A previous reply suggested an equalizer,,,I do
not agree unless you are seeking to impress the locals and in my case
the FT100MP gets consistent prais with its desk mike.
Hope that helps.

:IC-706 is not (and can not be) type accepted for use in the US
:Part 90 Land Mobile Radio Service. Though it seems it is very popular
:to use amateur transceivers in Part 90 service, it isn't legal.
:
It may not be legal- but-

Is the FCC going to know the difference?

Honestly, the answer would most likely be a NO, and this is especially if this person (the radio owner) is licensed to operate in this band.

Specific Type-Acceptance is a FARCE by the FCC to generate companies like motorola large amounts of money.... (or at least to RESTRICT the users of LMR)

General Type-Acceptance should be kept for all radios, (for obvious reasons)

25. Heathkit HW8, 40M/15M Antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-01 00:00:00 UTC
From: lui@netcom.com
Message-ID: <lui-2906961823160001@192.0.2.1>
Source record: 198630

I just borrowed a Heathkit HW8 QRP CW transceiver from a friend of mine. Does anyone know the specifications on this unit? What exactly does each control do (my friend didn't have the manual), i.e. Wide/Narrow, Loading, Receiver Pre-selector, AF/RF gain? What does the Relative Power meter mean? Also, I hooked the transmitter to a frequency counter, and the tuning scale reads 15 KHz too high, but I can tune the Tech+/Novice CW bands on 40 and 15 meters. Is there any way to adjust this?

Any suggestions for a 40M/15M antenna which doesn't take up too much space? I have a townhouse, and a >100ft dipole isn't practical!

>That OOK Morse can get through where SSB can't isn't exactly hot news.
>We've known that for decades. Of course when SSB can get through,
>it has higher throughput than OOK Morse.

Not always true. If you've worked NTS then you passed messages on voice that were at times 500% greater in length than their CW counterparts (using Q-signals and prosigns). And the WPM upper limit in passing voice messages is always determined by the speed the listener can write or type. "Please repeat all after..." must be included in calculating the "throughput" (almost as corny as your "wetware modem" expression).

>But both are bottom of
>the barrel methods compared to Clover, PACTOR, etc.

Your digital modes work only as fast as the initiator can mentally create a message and type it error-free (say, 60WPM combined); another limiting factor is how quickly the receiving op *and* destinee can read and comprehend the message. You're good at intentionally failing to include these human factors as an upperbound in speed when discussing digital comms.

Jeff KH2PZ / KH6

P.S. I know you love a large audience, but allow your followup proceed to the .policy group where the CW discussions belong.

: listening to the subband and you don't know it. That's a load of horse
: hockey, and v-e-r-y poor engineering.

: Anybody got a suggestion or a mod around this ?

Sure, it is simple - but might require drilling a hole in your rig, if
you want to be able to turn the mod on/off.

There are at least two simple mods. The first is to open on lead going to
ohe subband volume control and insert a spst switch with a high value
resistor across the switch. When the switch is closed, the resistor is
shorted, so the volume control works as designed. With it open, the
resistance is in series with the control - muting the receive.

You can also install a relay, tied to the transmit keying line on the
microphone - instead of the switch. Note that if the volume control
works at logic levels, then the keying line could be used with a logic
gate to pull the volume control line either high or to ground, whichever
is necessary to mute the circuit.

Other possibilities such as using a transistor, exist. The above should
provide a starting place.

Bill

I recently aquired some Microwave test equipment, antique test equipment, and some compenents from a state agency thats downsizing and wonder if anyone might be interested in any of the following....

Local State Agency downsizing and reducing inventory and excess gear, So I find myself the proud new owner of much Microwave gear and no need for it. List as follows....

2 EA - AN/UPM-12A Microwave test sets, Very good physical Condx as they are in transit cases. SWR Indicater / Frequency Meter, etc with Manuals and some accessories.

1 EA - TS-155C/UP Microwave Signal Generator, Great physical condx due to its in a transit case. With manuals and some accessories.

1 EA - Polarad Wide Dispersion Spectrum Analyzer Model #SA-84WA, 10 Mhz - 63.680 Ghz Range, Great physical condition with full documentation and service manual.

1 EA - Narda Model #802 Microwave Frequency Meter in very good shape. No Manuals.

1 EA - Metrodata # TR10 RCVR & # TD13 Telemitry decoder. Tunes 395 - 415 Mhz with 2 VFOs. Each in very good physical condx with manuals.

1 EA - Meuller 8069-B Laboratory grade Temperature Bridge. Antique in beautiful wood cabinet. Magnificent workmanship. In very good physical condx with service/operation manuals and documentation.

1 EA - General Radio Type 554-B Antique Megohm Bridge in wooden cabinet. Good physical condx with documentation.

1 EA - Model "S" Antique DC Microampmeter by Sensitive Research Instrument Corp. Very Good Physical Condx but no manual.

1 EA - MX-1309/urm-23 Microwave Power measuring kit W/Transit case in excellent condition.

1 EA - Bendix Aviation Nose Radar antenna assembly, 22" aluminum dish on very compact AZ/EL drive with feed and waveguide assembly that allows dish to rotate and still work. Very Good Physical condition.

1 EA - 3 Meter Spun Aluminum dish (Solid) with mounting ring on back. In good shape with minor dings.

1 EA - High Power Xtal Controled HF transmitter running 4 conduction cooled 7939's on 13.56 Mhz. As IS for parts.

Many other assorted bit and pieces too numerous to list...

Those interested can contact me at NC7K@VHF.RENO.NV.US for more information.

Howdy..

I have a few Questions...

I need info on building a Mobil Mag mount antenna for my Truck to use with my HTX-202..

I have been given some advice, but i am looking to build something cheap but looks NORMAL, someone told me to use a coat hanger, etc ..

I have 12 guage wire i can use, but need a little info, what length should i cut it at, to use it at 145.470 (local Repeater) I dont have any kind of swr meter or anything but my radio which will let me know when its pumping out full power...

any help will be most apprecaited (text files. urls. graphics, drawings , etc,, attach then to a e-mail please!!)

ALSO

I am looking for some ham mailing lists.. i am starting one for my areas repeater.. (for the members who have e-mail accounts..) and would like to join a few and echo some good info etc...

Please let me know how to subscribe to those..

THANX!!!

I have several counters for sale.

1st:
General Radio Type 1192/z counter w/manual
Freq: DC to 32MHz , 100usec to 10sec counting gate times. Displays Hz, kHz, MHz.
Other specs too numerous to mention. E-mail for more specifics.Was rack mounted so no external case available. Asking $90 plus shipping

2nd:
Fluke model 1900A Multi-counter w/manual
Freq: 5 Hz to 80 MHz
Period: 5 Hz to 1 MHz single and multiple period averages
Totalize: 1 count to 999999 counts
Other specs too numerous to mention. E-mail for more specifics. The handle is missing otherwise in excellent condition. Can be battery operated.
Asking $125 plus shipping

HP 5248M counter -as is- rack mount, no manual, $30 plus shipping

HP 5245L counter -as is- rack mount, no manual, $30 plus shipping

Datum Time Code Translator model 9200, no manual, $20 plus shipping

Systron Donner 8350 Time/Generator, no manual, $20 plus shipping

Polarad Modulator Model 1020T, this is a low freq signal generator., no manual, $25 plus shipping

Dranetz Phase meter, series 305, no manual, $20 plus shipping

You can get some very nice voice EQ by changing the limiter EQ in menue 25 & 26. Ie. want more lows let the limiter discriminate how it processes the voice signal by providing more compression on the low frequencies. Same for HIs.

KAWIN NEWS

KaWin 6.39 is ready for download! Minor changes to the help file too.

KaWin 6.39's enhancements are largely focused on the HF CW or RTTY operator, but there are some minor fixes that will be welcomed by all. They are described in the Squawk file.

HF DX and contest operators will find a competitive advantage in the new option to send every keystroke as it is pressed, and those with access to a DXCluster will be one click ahead of the gang when a new spot appears by clicking on a DX spot and instantly setting the callsign in the HF context. Also, the automatic logging of HF QSOs in non-connected modes is now subject to operator confirmation - no more log entries for unsuccessful DX calls.

All currently reported bugs are fixed in 6.39.

Guilty as charged ... but with extenuating circumstances!

Even with a ham ticket and a BSEE degree, that describes my VCR. Why?
It seems that setting the time on the darn thing is the surest way to
invite a power outage. Sort of like washing your car invites rain. <g>

Why is it that my $10 alarm clock with a $1 9v Energizer for backup can
go for hours without power and keep at least some semblance of the right
time? But let the power flicker off for a second or two, and it's
"Flashing 12:00" time for my VCR that cost 20-30X as much!

I assume you mean encrypt. It is illegal to encrypt transmissions on
the ham bands. If you're looking at doing it on non-ham frequencies,
you might contact Transcrypt International 402 474-4800. They make
encrypt/decrypt modules for portables and mobiles.

You can make a whip from just a 19 inch length of wire and a coax
connector, IE take a PL-259, solder the wire to the center pin,
and slip a piece of shrink wrap down over it so it can't touch
the outer wall of the connector (filling the cavity with epoxy
is even better). However, for mobile use you really want something
other than copper wire. It would be deformed with every tree branch
impact. What you want is copper plated music wire, with perhaps
an anti-corrosion nickel overplate. That's what commercial whips
are made of. Fortunately, these are cheap. You can get replacement
whips from many sources, often for only $2-$4. You can similarly
solder these whips into a PL-259 if you sand down to the copper
plate first. Your mount is just a SO-239 fixed to a plate attached
to a magnet.

There are enough variables in antenna mounting to make a ruler
measurement insufficient. You really need to borrow a meter to
trim the antenna on frequency. However, the HT is fairly insensitive
to SWR (since it usually has to work with a rubber duck which may
have a wildly varying SWR depending on how and where you are holding
it). So the antenna will work even if you don't trim it exactly to
frequency.

From: sander@aud.alcatel.com
Message-ID: <4r94hj$cgs@news01.aud.alcatel.com>
Source record: 198661

On my FT-1000MP I can't seem to find the control to turn down the CW sidetone.

I sure hope it has some sort of provision to turn down the sidetone because it's very loud. If I switch on the MONITOR switch, I can control the monitor level, but the sub-VFO indicator switches on when every time I transmit.

Am I missing something within the menu setup or one of the many controls on my FT-1000MP?

Did you know that there are Bulletin Board Systems (BBSes) that are oriented toward amateur radio? Well, there are quite a few of them and we are adding new listings all the time.
To find out where they are located, point your web browser to: http://www.vni.net/thedirectory and go to the "search engine." Enter the words "amateur radio" (and in a different search enter "ham"). It will return a list of area codes where the boards are located. Click on the links to go the individual area code listings.
Remember to return about once a month as we regularly find and list new boards devoted to amateur radio. There are also BBSes devoted to a wide variety of other topics that you may find of interest.

Just tune to the image frequencies between 778Mhz and 803Mhz. You can
hear plenty in these frequencies and the sound quality is almost as good
as listening to the main frequency. Hope this helps. 73

I think it is very important that one not stick a label on "americans"
or "germans" because of acts of their governments in the past, or
perceptions of the present state of mind as a whole. By not
corresponding with people from the country in question, you may never
find your view challenged, because you admit no more evidence.

HAVE AN OPEN MIND!

Lack of an open mind is stifling ham radio!

65. Assistance with ZETEL "Smart-Patch" AUTOPATCH HEELP!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-02 00:00:00 UTC
From: dirk_yohn@miu4.k12.pa.us
Message-ID: <4rbl05$s8e@saturn.exodus.net>
Source record: 198520

Dear radio enthusiast:

This summer I picked up a ZETEL smart-patch during a local hamfest. The gentleman selling the unit connected it on the spot to a gel-cell battery to confirm that the logic circuits of the unit operated, and as far as I can diagnose, the radio accepts all functions normally and displays the correct sequence of lights. The problem is that I cannot get the unit to key up my radio (An HTX-202) when the patch is put into use. I can manually press the PTT button and HEAR the phone audio going through, but it does not activate the transmit circuit on the radio. An aquainteance of mine who deals in electronics equipement suggested that in all probability, a switching transistor is not functioning on the vox circuit of the unit.

I have written to a number of local hams, but the only response I get from everyone is "Too busy", "Dont know about patches" or something along those lines. Yet SOMEONE connected one to our local repeater - Go figure. Anyways... I need this thing serviced or would like information from anyone selling an autopatch that does not have to directly interface with the radios electronics (This unit plugs into the EAR and MIC jacks, utilizing VOX circuitry.)

If you can provide me with ANY assistance AT ALL ... I am willing to either pay money, or trade a COMPLETE computer system, for it's repair, or a device similar to this one. I have the manual, which includes a schematic and a complete parts list with all of the values.

Please contact me via one of the following meathods if interested:

>
> - Craig, AA0ZZ

Craig,
I looked at both when I was "shopping", and came to the conclusion that the FT-10 was a very solid
little radio. I bought one and have been *VERY* satisfied with my choice. My experiences (frankly, I've
dropped mine a few times...) have borne out my initial observations regarding the radio's solid
construction. Due to it's very small size, it's also a pleasure to carry on a belt. I keep mine in one of the
neoprene "holsters" sold by a variety of third party vendors.

Drawbacks? Only two that I want to tell you about: #1 Like many really small HTs, if you attach a
"high" gain antenna (that nice 5/8ths mag mount on the car roof for example...) rather than it's stock
"rubber duckie", you may have intermod. This is not a big problem for me, but others have told me it is
for them. #2 The special "ring-ring-ring-tip" plug used for a speaker/mic or a TNC is *NOT* available as
a "part". To attach an off brand mic or any TNC, you'll need Yaesu's adapter (around $10).

I honestly like my HT-10 and would consider it to have been a good purchase. No, I don't work for
Yaesu either.

One of the locals is using a nifty cellular phone holder for his HT. It
has a sort of "clamp" feature that holds the HT in place, squeezing it
from the sides, and has a one-lever quick release. I have no idea where
he got it, but I've seen people using them with cellular phones too (the
thin pocket type phones, that is). FWIW...

The article on this was in Hands on Electronics I think, about 5 years
ago. I will see if I still have it.

The razor blade is the correct one with one minor detail, the blade
needed to be used, with the hot spot being next to the corrosion. Use
a pencil lead for the pickup, an old drawing compass is a good way to
mount the lead.

As for the construction follow any crystal radio direction, make it
work with a germanium diode, then replace the diode with the razor
blade setup.

Good Luck\

Amateur equipment is generally not subject to type-acceptance procedures.
Both Part 95 (CB Rules) and the type acceptance rules prohibit the
external adjustment of the transmitting frequency. It's a safe bet that
none of the amateur rigs ever could be acceptable to the FCC for 11M CB,
though they were fine back when 11M was still an amateur band.

81. Kenwood R-599 2M Module question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-02 00:00:00 UTC
From: KB0WFT <72050.2144@CompuServe.COM>
Message-ID: <4rc6oklot1@mhadg.production.compuserve.com>
Source record: 198536

I've was recently obtained an old Kenwood R-599 Receiver (along with its twin HF transmitter). The receiver has a 144 Mhz add-on. It all works great, except I can't figure out how to determine the 2 M frequency I'm monitoring. The Receiver has a 144Mhz "A" and "B" selection switch which works in conjuction with the HF Band selection switch to get to different frequencies. I don't have the manual for the 144 Mhz module. Can anyone explain how to determine the receive frequency for this unit?

Thanks Much,
Roy - KB0WTF

Source record: 198538

Hi Gary,
you mean all that high gain backgound noise I hear when no signal is present on my FT-900AT is due to something else rather than just having the front end run wide open. An think, all I wanted Yaesu to do was to give me a source for installing an RF GAIN control like on the FT-890. There is a mod for this but I cannot seem to be able to get Kevin Karamanos to fork it over. He is a ham too (wd6dih).

If you are willing to spend some bucks to get an off-the-shelf setup which
is very secure, get some DVP-XL Motorola Sabers from someone on the net.
DES-XL will work fine also, but may be more difficult to get out of the USA.

I don't know your requirements... perhaps some simple analog frequency
inversion contraption is sufficient for you.

>comments/comparisons on these to help us make the choice? Thanks.

>- Craig, AA0ZZ

I have the FT-50 (same size as the FT-10) and also an FT-11. Although
they look about the same size, the FT-11 feels much smaller to me
because it is thinner. For a single bander, I prefer the FT-11. Also,
you have a better choice of accessories there. The antenna is standard
BNC and the speaker mike connection is standard also. On the FT-10,
there is NO third party alternative to the stock antenna that I am
aware of. The sex is reversed compared to the Standard 508A and the
FT-50, where thew Comet SMA-3 offers an alternative.

Just my humble opinion.

I just purchased a new Yaesu FT-50R HT, with the programming software. I recall reading a message that claimed the software allowed the restoration of the Cellular band freuencies...possibly in a European mode? The software I have is: ADMS-1C It's the latest version, and I do not see any provisions for this. Did they take it out?

Also, does anyone know the extended XT frequency range, after performing the hardware modification?

Thanks, Bill Crocker

The Measurements model 59 and 159 are in a class by themselves. Take a 40" length of wire suspend it clear of other metal. Place the measuremnets GDO at the current loop and you will see a BIG dip @144 MHz (or so). Try this w/ ANY other GDO and try to get ANY dip.
These are available @ fleas and Hamfests for $75-100.

I too have the same radio and software. The post I saw was referring to
some software out of the UK and specifically *not* the ADMS-1C software.
The poster did not know the name of this magic software and was loking
for info on it.

I did the hardware mod the other day but haven't had time to see it it
added any receive coverage.

Hi Tony,

Thanks for the tips on the NIR 12. I am trying to locate
a copy of the US ham magazine "QST"...someone mentions a
review in there.

I am curious about hookup -- is this just audio-in and audio-out
(to headphones or external speaker)? Also, any provision for TX
ssb audio enhancement or is this a receive-only unit? Just
curious --- still interested in optimum CW performance.

How much do these cost in the USA?

Finally, what kind of power is required for these units, and, do
they come with a wall-power supply or require 13.8VDC ?

Not really. Once a link is established, it holds very well against
interference. Since modes like Clover have a very closely controlled
occupied spectrum, stations can operate on 500 Hz centers without
mutual interference. When a rogue does come on, the protocol patiently
continues to operate, retrying when the rogue does manage to clobber
one of the FEC protected frames.

Packet is a different can of worms. Because it doesn't offer robust
error correction, and uses a go back N recovery algorithm, it suffers
greatly from interference. Note, however, that 30 baud is still 45 WPM.
My high school typing class had a minimum passing speed of 60 WPM.
30 WPM typing is definitely in the hunt and peck category.

If I remember from doing a review on the 1000mp a few months ago there
is a sidetone adjustment screw on either the side or in the back (or
maybe in that top hatch). It was one of the few things that I felt
could have been improved on the rig. I felt that it would have been
nice to have it as a front panel control or a menu item.

Terry:

The 101E is all solid state, except the final amplifiers (and maybe the driver). I'ts output is approximately 130 watts SSB/CW and 25-40 watts A.M. I bought one in 1977; I believe the 101 series was originally built in the early 1970's.

Good luck and best regards,

[Jim Nitzberg WX3B]

Yes. Through the end of 1994, they used "the previous several years" and computed a 7% growth rate of the U.S. and 7.5% for outside the U.S. But that also included the "bump" of people who held of getting licensed in advance of the new Tech license which produced very high growth rates for the next couple of years.

Yanntug:

I'm sorry a few folks on the Newsgroup gave you such a hard time with your request. A few of us need to remember that Internet is GLOBAL and most countries don't have a FCC nor do they have the same laws and regulations we, as Americans, must obey. Yanntug, I'm not about to presume to tell you what the rules and laws of your country are.

Yanntug, try a company called JRD MICRODEVICES in San Jose, CA. 1-800-538-5000 for orders only.

Use (2) Kits: RKSS-7 SPEECH DESCRAMBLER/DESCRAMBLER at $39.95 each. Each kit is both a ENCODER (sender) and DECODER (receiver), all on one card. You will require one kit per radio! One kit will NOT be enough for your needs! This kit appears to require a medium measure of technical background to assemble and connect. I estimate the assembly time to be about 1 1/2 hours each.

JRD may be willing to sell you a manual to review, before you purchase the kits?

Be SURE to ask for the new catalog!

73's
Uncle T.
WA6IGJ

I was just wondering if any HAM radios manufactured in the 60's, 70's or
80's were type accepted to legally transmit on 11m or CB frequencies?

I know some HAM radios had 11m as one of it's band like the
Yaesu FT101E but I think it was for receive only.

Also What HAM transceivers had CB as one of the bands for receive
but I'm not talking about transceivers with general coverage receive?

Radio I know of are Yaesu FT101E, Swan 1011 and I think Kenwood
had a model like the TS-520 or TS-530. What models do you know of?

Dear Gary,

Check out the article on the "Steath" antenna reviewed in this month's
CQ Magazine. I wouldn't say it's indestructable, but it's the best so
far.

>I can recommend it highly, but would add a word of caution. A DSP cannot
>help if the signal is below the receiver noise thershold - it cannot
>enhance what is not there. For reducing white noise and interference, it
>works great.

A receiver's "noise threshold" is a function of the bandwidth in which it is measured. If we assume receiver noise is thermal (more on that later), then decreasing bandwidth decreases the amount of noise passed through with the signal, and the receiver MDS (Minimum Discernable Signal) becomes lower. MDS is defined as the signal level into a receiver where the signal power out of the receiver is equal to the noise power out of the receiver, IE we see a 3 db change in total power out of the receiver between signal present and no signal present at the receiver input. (Often that is not *truly* the minimum discernable signal because we can detect changes smaller than 3 db, but it is an easily measured parameter which is proportional to the real minimum discernable signal.)

For this purpose, the audio DSP filter becomes part of the receiver system, so we now look at noise power out of the DSP compared to signal power out of the DSP. If receiver noise is thermal, it will have a gaussian distribution, IE the power is distributed from DC to daylight (figuratively). If we use a narrow filter, the amount of noise power that passes through it will be less because it doesn't pass DC to daylight, but if the filter is not narrower than the desired signal, all the signal power will still pass through the filter, so our MDS becomes lower.

A DSP with a 50 Hz bandwidth will give a lower MDS for the system than the 500 Hz IF filter in the receiver can provide because it lets through 10 db less noise power. The signal is always there, it is the amount of noise we let through with it that changes. (Assuming the receiver isn't being driven non-linear by some strong interfering source.) Of course when we go to a filter narrower than the signal, we start losing signal power as well and we approach a hard limit on what we can do simply by narrowing

the passband. When the filter bandpass shape exactly matches
the signal's spectrum, we call this a matched filter, and it
is the best we can do with filtering to improve MDS.

There are other tricks DSP can do, however, which can allow
us to pull out signals which are below the noise. Again assuming
gaussian noise, the DSP can do correlation with the signal because
the signal is coherent and the noise is random. If we know something
a priori about the signal, such as its frequency or phase, we can
use correlation to gain another 15-20 db against the random noise.
(Of course with random contacts on CW we usually *don't* have any
a priori knowledge of the signal, but if we're working with CCW
or any of the other coherent modulations which share some sort
of common reference with us, we stand to gain that extra 15-20 db.)

With stronger signals, this info can be extracted from the signal
itself, and thus we can use DSP to reduce the background noise.
This is one of the ways that "denoising" works with these DSP boxes.
When the signal gets down to within 4 db of the noise power in
the passband, however, self-extracting convolution doesn't work
(at least at the present state of the art) and these denoising
boxes start to treat the desired signal as just another noise
and reduce it too. So for really weak signals, you're better
off turning off the denoiser and depending on the matched
filter instead.

Now all of this assumes that receiver noise is thermal, IE
gaussian white noise. It often isn't, however, and that can
give the DSP something to get its teeth into. The DSP can use
spectral subtraction to remove noises from the receiver which
have some coherence pattern to them. (This is also how hetrodynes
are removed from the passband.) One such noise is AC hum, another
is flicker noise. Some recent tests have shown that flicker noise
is a larger component of modern receiver noise than had previously
been assumed. A DSP programmed with this in mind could offer
substantial MDS improvements.

One *good* thing about thermal noise, it "dithers" the signal
and keeps it above any real hard threshold in the receiver.
It has recently been shown that the deliberate addition of
noise to the signal path can enhance signal detection under
the proper conditions by allowing a finer discrimination of
signal level changes. Pseudo-noise is better for this than
truly random thermal noise, but even thermal noise can be an
aid if the system is designed to take advantage of it.

One obvious thing that can be learned from this is that a
DSP with a finer resolution becomes more important as the
difference between signal and noise becomes less. That is
to say, the DSP (and its A/D and D/A converters) needs to
use more bits per sample if weak signals are of paramount
concern. And the sampler needs some form of AGC to keep

the signal centered in its sampling window. When signals
can only ocasionally toggle the LSB on and off (and noise
is doing it too), there's not too much math the DSP can do
on them. The more bits swing the DSP has to work with, the
better it can do in isolating the signal from the noise,
IE quantization error becomes a smaller factor as the number
of bits per sample is increased. (I'm afraid this is simplistic,
lots of bits don't *guarantee* better performance, but it
can if the algorithms take full advantage of the extra
information.)

Another technique can be used which trades sample resolution
for sample speed. This is called oversampling, and in the limit
case can actually do useful things with a single bit sampler.
Yet another trick can be used, called quadrature sampling.
This requires two DSP channels, but it can give us another
6 db of discrimination between the desired signal and noise.

What I'm trying to say here is that the signal is *always*
there, though it may be buried in mountains of crud. As
the old saying goes, with this much manure there must be
a pony in there somewhere, and the DSP uses a number of
tricks to try to dig him out. As long as there is *something*
different about the signal from the noise in which it is
buried, and the DSP knows what that difference is, it can
use that knowledge to discriminate between the signal and
the noise. (That's one reason coherent modulations are so
powerful, they give the decoder something known to look
for other than just a crude amplitude difference with the
noise.)

Hi Alex.
there are several clubs in the Tampa area, TBARS Tampa Bay
ARS meets the second tuesday at 730PM at the Tampa Red Cross chapter.
Info on 147.105 repeater.

TARC meets alternate mondays, for info call Bud ac4my on 147.105.

there are several other clubs in the area. Call on 147.105 or146.94
for Tampa area clubs and 146.97 for the Pinellas area clubs..

Hope this helps 73s

I believe that you will find that the word `irregular' has the
literal meaning of `against the regulations' in Franglais.

Before you drop all that cash at your local music/electronics dealer,
remember that commercially built amateur radio transceivers already
pre-filter the mic input to 400-2400 Hz, or roughly 4 octaves of audio
spectrum. You certainly won't need the other six octaves of EQ that
you'll be forced to pay for, but I doubt that you'll get 60% off the price
as a result.

Of course if you use the manufacturer's pre-filtered microphone (of the
proper impedance) ahead of the rig, you'll have a cleaner and better
sounding SSB signal, and more money in your wallet to boot. As far has
having two audio characteristics, you can always buy the Heil dual element
microphone for about a third of what you'll pay for the studio mic / EQ
combination.

A few weeks ago, I casually read some posts about making a foxhole radio using a razor blade as a rectifier. Last weekend, I fell into possession of a Gillette double edge blade with a sky blue finish still in the original wax paper. Is this the type I need? If so, can someone give me enough details to make an authentic one? Also, any documentation, anectdotes, or facts that would help to make it an educational display would be appreciated.

Yeah man... Right ON!!

You have broke the code, but it's much more devious than you know.

The REAL story may be that those guys wanted the channel to expand their secret hemp farming business???

I was sitting in the side of the road and as one of those GREEN colored trucks passed by and it came to me like a .. ya know.. like a message from god or some other important wise dude.. maybe it was Timothy O'Leary...anyway... like you know what I mean, man... it was a revalation or something...

Them dudes are out to corner the market for all the good stuff once it's legalized.

Why else wuld they use GREEN trucks... and those guys running around in hemp colored clothing... and they already go to EVERY bodys house anyway... it's so obvious once you see the light...

They want to put honest business men like those at High Times out of business just because they print articles on how to make your own dope and they let you know where to get all the LEGAL things that help a good grass crop.. they don't want YOU to home grow what they may be seeling some day......

Yea, just sit back and take another puff and think about it..... it's a bad scene man.

I think they should legalize mairjiuana and any other form of suicide an individual wants to practice, no matter how stupid it makes them.

I'm glad you made us all aware of this gigantic conspiracy, maybe you can get the attention of some high government official to look into this. Too bad none of them inhales though.

129. PHOENIX ONLY!!!!!!!!!!!!!!!! FT-10R FOR SALE!!!!!!!!!!!!!!!

130. Re: FT-50R software?

Message-ID: <4re41k$vfc@quake.garlic.com>
Source record: 198417

The ADMS-1C software still allows for the European band plan... and it works well.

I've been working on a list of features, mods, etc. for the FT-50... my buddies say that it makes sense, so I'll attach it to this message.

NOTE: It's easy to mess up your rig by doing this. If you are in the least bit squeamish, DON'T DO IT!!!
------End Disclaimer

And now... Presenting....
The (In)Complete Guide to the Yaesu FT-50 Version 1.0

Compiled by Bill Childers, KE6VVW

Disclaimer & Other Nonsense
The information in this document is a guide to the FT-50 ONLY. Having had more than a few radios in my amateur experience, I understand how most hams wish to learn as much about their rigs as possible. I have compiled this guide to allow other people to learn more about the radio without having to search all over for information. I do not guarantee the validity of this information, as Yaesu may change programming or hardware so that some of the techniques in this document may cease to function. I am not responsible if these instructions damage your rig in some way. All I can say is that I have performed the following procedures to my unit, and I am quite pleased with the results. Your mileage may vary, etc.

Introduction
The Yaesu FT-50 is perhaps the most unique VHF/UHF Handheld manufactured today. It's made to MIL-SPEC 810, for dust, splashproofness, and vibration. Out of the box, it has not only dual band 2m/440 capability, but wide FM receive and AM receive as well. In addition, it receives 76-200 MHz, 380-500 MHz, and 700-900 MHz (Cellular Blocked). It has one of the fastest scan speeds for an amateur HT. It also has the unique ability (w/ ADMS-1C software) to interface with an IBM PC running Windows and have memories and settings uploaded/downloaded. In addition, it has DCS (digital coded squelch), ARTS (auto-ranging transpond system), and Yaesu's excellent transmit and receive battery saver features. It also uses Yaesu's extremely efficent FET power module that allows for 5W+ of output power with a 9.6V battery pack. With the optional FTT-12 keypad, the unit also performs CTCSS decode, DTMF paging, and also incorporates a Digital Voice Recorder! All

of this functionality in such a small package makes it my rig of choice.

Problems (Bugs)
Unfortunately, the FT-50 is plagued by a few bugs. None of them are very serious or life-threatening, just a bit annoying. First among them is its Wide-FM receive. Apparently Yaesu engineers didn't put a wide enough filter in the unit, and some of the bandwidth of broadcast FM signals gets "chopped off". This means that the rig is near useless for listening to music on the broadcast FM band. It works marginally with voice only on the same band. My opinion on this problem: If you want to listen to music, bring a small Walkman or other transistor radio with you. The 50 does an adequate job of bringing voice signals in on broadcast FM, so it's good for listening to emergency broadcasts.
The second "bug" lies in the optional FTT-12 keypad. The manual for the radio states that you can set up a "voice mail" type of functionality that lets your radio operate unattended and record calls for you. This mode doesn't work correctly, although the built-in voice recorder works great. The problem appears to be in the DTMF page-answer-back area. If you're buying the 50 and FTT-12 solely for this purpose, DON'T! It doesn't work and there's no current workaround.
The third bug has been complained about a bit. It seems that some 50s suffer from a low Tx audio problem. This is due to a factory adjustment that is set a bit on the low side. It is easily fixed. (See Factory Adjustments below).
The fourth "bug" is synergistic with the ADMS-1C software. If there is some kind of problem in downloading a file to the radio, the software aborts with an error, and the rig is left with it's memories cleared in a "limbo" state. This state is actually the European band plan, and if done properly, the rig can be modified to receive even more frequencies which will be described later. (See modification section) However, if you want to return the rig to its natural state, simply download a blank frequency file (NONAME.RDF) to the unit. All should be well.

Factory adjustments
If your rig suffers from the low Tx audio problem, here's how to fix it.

1. Remove the battery and antenna.
2. Remove the "NiCd" sticker on the heat sink. If you remove it very carefully, it's possible to re-install it later with the same stickum that's on it.
3. Look in the cavity where you removed the sticker. Proceeding from left to right, here's what you'll see
Phillips head Screw (Holds the keypad in)
Small Silver Potentiometer (VR1001VHF Deviation Adjustment)

Small Silver Potentiometer (VR1002 UHF Deviation Adjustment)
Small White Potentiometer (TC1001 DONT TOUCH! CTCSS Tone Adjustment!!!)
Phillips head Screw (Holds the keypad in)
4. Take a small Phillips head Screwdriver and turn both VR1001 and VR1002 about 1/8 turn clockwise. This will increase the VHF and UHF deviation and fix the low Tx audio problem. If it s not enough Tx audio, simply turn both pots another 1/8 turn. Make sure to turn both pots the same amount!
5. Replace the NiCd sticker, battery, and antenna.
6. You re Done!

How to make the FT-50 Transmit with ~7.5W output while on 12V supply (May not work on some radios)
NOTE: This setting is supposed to work on factory radios it appears to work part of the time.
It also appears to work better after modification.????

1. Select 2m VFO frequency.
2. Turn the radio off.
3. Push LAMP, PTT, Knob, and PWR at the same time. The rig will turn on with the squelch open, so turn the volume down!
4. The 50 will display "BAND xxxxxx" where xxxx may differ depending on your radio and whatever mods you may have performed.
5. Turn the top knob counterclockwise 4 clicks. The display should read "HIPO xxxx" where xxxx is the factory setting for the Hi Power Output. Make a note of this number if you wish to return the radio back to its stock output power setting!
6. Push in the Top knob. There will be a "s" that appears next to the displayed number.
7. Rotate the knob clockwise. As the numbers increase, the output power will also increase. Maximum power is 255 although be warned that the radio gets REALLY hot at that setting.
8. Push the knob for more than 1 sec to save the setting.
9. Select 440 VFO frequency.
10. Repeat Steps 3-8 to adjust the UHF Hi output power.
11. Make sure not to mess around with other settings they control S-meter swing and squelch sensitivity.

Modifications
The FT-50 is extremely easy to modify. The first modification is performed for you at the factory but for those of you who accidently disabled it, or changed it here it is.

Extended U.S. Receive Mod (Expands receive from 144-148 & 430-450 to 76-200, 380-500, 800-999 cell blocked) NOTE: All memories will be erased.
1. Turn the transceiver off.

2. Hold down the Knob and Lamp keys while powering the unit on.
3. The unit now has U.S. Extended Receive.

MARS/CAP mod (Extended Transmit Mod: app. 144-159, 420-470) NOTE:
All memories will be erased.
Don't transmit on bands that you're not licensed for!! Besides
being illegal, it creates problems for people using those
frequencies.
1. Remove battery & antenna
2. Remove NiCd Sticker on Rear Heat Sink
3. Loosen (Don't Remove) Philips head screws on rear that hold
keypad in.
4. Use screws as thumb holds to press keypad out.
5. Remove screws.
6. Remove Keypad.
7. Under Keypad on Left Side there is a series of Solder Jumpers.
They are labeled in white from 1-3. Only #1 will have solder
jumpering it. Remove the solder, being careful not to damage or
touch any other components. WARNING: If you're not good at
desoldering, or have shaky hands, you might want to have someone
else do this for you. It's REAL easy to damage the rig.
8. Reinstall Keypad. Be careful of the O-ring around the keypad.
Make sure it's not twisted or damaged, as the waterproofness of the
unit could be compromised.
9. Install sticker, battery and antenna.
10. Hold down Knob and Lamp keys while powering the unit on.
(Extended Receive Mod as above.)
11. Completed!

Super-Hyper Awesome Mod The mother of all Mods!!! (Requires
ADMS-1C software and MARS/CAP mod to be performed)
Receive: 76-999 Mhz (No displayable holes!!!)
Transmit: 120-221 Mhz, 320-499 Mhz (AGAIN, Don't transmit on
frequencies where you're not licensed)
NOTE: This mod will disable ARS (automatic repeater shift) and will
set 2m and 440 repeater offset to
weird numbers. Make sure you enter repeater offset and +-
shift manually. Repeater offset needs
be set once for the rig, then it should be able to be
forgotten about. It will also clear memories.
Remember above where I mentioned the ADMS-1C software having a bug?
Here's where the enterprising and curious ham can take advantage
of that. This mod will install the European band plan in your
radio so without the MARS/CAP mod you will lose the top portion of
your 2m band.
1. Are there frequencies in your radio? Don't want to lose them?
Simply get the data from your radio as it sits you can "merge" the
frequencies later. Save the file.
2. Perform the MARS/CAP mod as outlined above. Get the data from
the mod and name it USA.RDF.

3. Attempt to send the same data to the radio. In the middle of the transfer (around 50%), pull the adapter cable to the PC out of the radio.
4. Thanks to the bug, your radio is now in European mode! Perform the Extended Receive Mod by holding the Knob and Lamp keys down while turning the unit on.
5. Now, the Automatic Repeater offset doesn't work. There's no workaround. Note that the 2m offset has been changed to 0.00. Go to the menu by holding down the knob. Go to SHFT, Option 7. Press the knob. Turn the knob so that it reads 0.60. Press PTT.
6. Now, turn off the radio. Put it back into clone mode. Read the data back from the radio to the PC and save the file as EURO.RDF.
7. If you want to enter frequencies manually or using ADMS as normal, go ahead. Everything should work. If you saved frequencies as above, open EURO.RDF and "merge" the frequencies from your USA.RDF file into it, and save it as another name. Then send the modified EURO.RDF (your filename) file back to the radio using the "template" file EURO.RDF. You're done!
8. To return the radio back to the U.S. band plan, send the USA.RDF file back to it.
Note that I have no way of measuring the sensitivity of the frequencies or the output power of the rig outside of the ham bands. The 220 coverage seems to be very poor, however, the radio does display 220 frequencies. It won't transmit on our 220 bands, though. 800 Mhz receive is vastly improved.

131. IC-706 and Pocket Dialer

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-03 00:00:00 UTC
From: jones@San-Jose.ate.slb.com
Message-ID: <4rf1bj$65o@k9.San-Jose.ate.slb.com>
Source record: 198418

I have an Icom IC-706 that I've installed in my pickup truck (it still needs some "finishing touches", like running the permanent power cable, but that's beside the point for this posting).

I'd like to be able to use the local 2M autopatches, but as we are all aware, the '706 doesn't include a DTMF pad.

So the obvious solution was to run down to Radio Shack and get their Memory Pocket Tone Dialer (Cat. No. 43-146, or at least that's what it says on the back of it :-).

I quickly programmed in the access code (simply a '*' for ARA repeaters) and my home phone number. However, I can't get it to actually bring up the patch through the IC-706. (I've tried just about every dialer-mike position I can think of.) I've tried this with two different repeaters.

I know the Dial works right (and is programmed correctly) because I tried using it on a 440 repeater through an HT (instead of the HT's built-in DTMF pad). I also know that the repeaters are working OK, as I have heard other people using the autopatches immediately before and after my attempts.

I also have absolutely no problem getting into the repeater with the '706. On one occasion I had someone listen to the tones on the input frequency, and he reported that they sounded good.

Has anybody gotten this, or some other tone dialer, to work with the IC-706? Any tips?

73,
Clark

>
> Any idea how they got around that one?
>

Most of today's commercial band radios are programmable. Some from the
front panel,
and others via a computer. A lot of the radios that are front panel
programmable, require
a jumper to be placed inside the radio in order to program it. Others
require a special code,
or a certain sequence to be entered to get to the programming mode.
Normally, the dealer
is the one that programs the radio, and the end user does not have any
need for reprogramming.

However, there is nothing to stop a large company from obtaining software
and or programming
codes so that they can program their own radios. I know of one local
police department that bought
all the hardware and software to enable them to program their own radios.

Dear Mr. Fisher,

In your permanent attempt to be a nuisance to everyone on these
news groups you also quote your MEOL account. Although you
have a commercial provider for your dirty work, you should
have a look at MEOL policies and the responsibilities of
teachers envolved therein:

---------------------------------------------------------------------

Mass Ed Online LearnNet Policies

PURPOSE
The purpose of the Mass Ed Online LearnNet is to advance and promote
education in Massachusetts It is intended to assist in the collaboration and
exchange of information among all who are concerned with education.

GOAL
The goal of the Mass Ed Online LearnNet is to promote innovation and
educational excellence for all learners in Massachusetts schools.
To achieve this goal, the network must provide high quality information
and communication resources to the educational community in an equitable,
cost-effective manner, while promoting a safe and secure environment for
use of the network and respect for the individual rights of all users.

USERS
Primary users of the Mass Ed Online LearnNet are teachers, administrators,
and other educators. MCET may permit others to use the network,
provided they demonstrate that this use furthers the purpose and
goals of the network and public education in general.

POLICIES
The use of the Mass Ed Online LearnNet is a privilege. The user is
responsible for what he/she says and does in the online community.
Because communication with thousands of others is so quick and easy,
it is important always to think before speaking and to show respect
for other people and for their ideas.
```

It is beneficial for all users to keep the network running efficiently.
Each user must take responsibility for keeping down costs and avoiding
system disruption.
(See "http://meol.mass.edu/training/netiquette.html" Netiquette and
Strategies for efficient use).

.....and so on.

I bought an FT-10 about 6 months ago. I like the radio with the one drawback being the antenna connector. The adapter to allow me to use a BNC connector cost about $10 Canadian. All in All I think the FT-10 is a great radio

I want to thank all the many folks who responded to my request for information about the referenced HF radios, especially in regard to their performance on CW and Pactor. I received a great many helpful responses, and the overwhelming recommendation was the FT-1000MP. I have put all the responses in a file, and would be happy to mail it to any interested amateur.

My new FT-1000MP arrived yesterday, and I am very pleased!

>a tuner for this rig

The crystal socket is not an "extra" socket as such. You can plug in an FT-243 style crystal for crystal-controlled transmit instead of using the VFO on transmit. The crystal socket doesn't give you an extra band.

As for using a wire antenna, I'd suggest using a transmatch with it. The PA in the HW-7 does not really have the capability to match anything other than close to a 50 Ohm load. The older tube-type PAs could usually do it if the wire was cut to a resonant length, but the solid-state rigs can't.

>[Jim Nitzberg WX3B]

Hi, Jim. After 15 yrs absence from the low bands (HF), I got back on last month with the purchase of an FT101EE. Previous owner had replaced tubes a few months back, so tubes are in good shape. I really like the old rig. Having never owned a solid state rig, this one is like my old one from years back, and I don't mind a little tuning. Working into a dipole, I have no trouble making contacts with almost anyone I can hear, and nearly always get comments on the excellent audio. If you get one, let me know your impressions.

Tnx and 73

>> the hardware modification?

The "mod" is not really a feature so much as a bug. To get the wide band coverage, start a data download to the radio and then interrupt it before it is complete. (Be sure to save a template file of the original configuration.) After the interrupted download, the radio will be left in a state with receive from 76-540 and 590-999 MHz. However, the transmit range will be only 144-146 and 440-450 MHz. You will have to perform the extended transmit hardware mod to get the mssing sections back. To do this, remove the keypad and unsolder jumper 1 underneath. After that, the red light goes on to indicate transmit in a VERY wide range. Actual power out varies quite a bit, though, at least on my unit. I have heard that it may take a couple of attempts to get the receive mod to work, but it worked first time for me.

Karl Beckman:

Check the specs on the Kenwood 950SDX and TS 870. TX will go 100 to
3.1K. Receiver will do 100 to 2.85 and better, almost 3.1 with DSP.
You would be surprised to hear the fidelity that can be generated
within this bandwidth. NASA's research showed that the 680/720 Hz mark
is the voice intelligently point, and when you dress it with the
proper EQ, round it off with some audio bandwidth shaping, add a touch
of gating, with enhancement, then your audio comes alive!! I guess
you've never heard, W2ONV or EA3OT and their HiFi QSO's on 20, very
impressive!! They have really opened a new frontier in SSB TX'ing!!

Thanks,
Billy

Went to Texas for training for a couple of weeks during June and when I came back found that my Kenwood TS-850 apparently died from lonesomeness. The frequency display blinks sometimes during QSY and sometimes only dots are displayed. After doing the (panic button) reset it now sends UL in an ancient code. The rig is in the 5-6 year age now. Is this just a dramatic appeal for factory calibration or could the Lithium battery cause this? Enquiring minds want to know!

Charles,

Yes, you have the right kind of razor blade.

I made many of these razor-blade radios as a young boy, from plans in a Boy's Life magazine. Probably about 1959 or so. They really are amazing. NO EXTERNAL POWER! I haven't actually built one for years, but need try it again also!

Here is the basic plan, as I remember it.

Top view: (Sorry for crude ASCII drawing...)

```
\-|-/ long wire
\|/ antenna
RAZOR BLADE |
+--------------------------+ |
| / | |
| Screw A /-/ | Screw B |
+------|- - - - - -(+) /-/==============(+)-------+
| | ` /-/ | |
| | ` lead / | |
| +------------`-------------+ |
----- | |
/ / / | |
good ground | |
(water pipe) | |
| |
+---------O O-------------+
Headphones
```

1) Carefully buff the double-edge razor blade with a grindstone to remove the coating and make it more sensitive.

2) Mount the razor blade loosely on a board, with a 1/2" screw (Screw A) throught the center hole. Put a couple of washers underneath the blade to lift it off the board and another washer above the blade.

3) Take two pieces of insulated bell wire about 5" long and remove a 1" piece of the insulation in the center of each of them.

4) Wrap the bare section of one of the wires around the razor blade screw between the bottom washers that hold it off the board. These two pigtails will be used for connecting to the headphones and ground.

5) Put a couple of washers on another 1/2" screw, and mount it (loosely) to the board about 1/2" away from the edge of the blade.

6) Wrap the bare middle section of the other 5" wire around screw B. These two pigtails will be connected to the headphones and antenna.

7) Get a 3/4" piece of pencil lead. I recommend carving up a wooden pencil (remember those?) so you can get a good strong piece. Sand one end flat (blunt).

8) Cut a bare piece of bell wire, about 2 inches long. Now wrap one end of the wire around the pencil lead about 5 times. (Now you know why the lead needs to be fairly "fat".) The lead should protrude from the bottom of this little coil of wire.

9) Mount the other end of this wire to screw B.

10) Tighten both screws.

11) Bend the piece of wire holding the pencil lead so that the blunt end of the lead rests on the surface of the razor blade with as much surface contact as possible.

12) Connect one of the wires from screw A to a water pipe and one of the wires from screw B to a long piece of wire for an antenna.

13) Connect the other wire from Screw A to one side of the headphones. Connect the other wire from Screw B to the other side of the headphones. (Sorry, I don't have the specs on the kind of headphones to use; I had a cheap pair and they worked fine.)

14) Listen.

To tune the radio, carefully wiggle the lead (or wire holding the lead) and move it around the surface of the razor blade. Let go when you hear music! You should be able to pick up local AM radio stations.

Have fun! Report back if it works!

- Craig, AA0ZZ

155. How do directional RF wattmeters work ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-03 00:00:00 UTC
From: skubi@angela.inria.fr
Message-ID: <4rekb7$4e8@news-rocq.inria.fr>
Source record: 198483
Cross-posted to: sci.electronics.basics,sci.electronics.components,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I do not understand the principle of the simple directional RF wattmeter.

I consider the following setup: a line carries RF power in two directions simultaneously (eg. power flows from transmitter to antenna, and, because of impedance mismatch at the antenna, some power is reflected back to the transmitter).

A section of this line is made of strip line. There is a second section of strip line, parallel to the first one (and, thus, inductively coupled with it). The second strip line goes from a loading resistor which suppresses wave reflection to an AC voltmeter.

Both sections of strip lines are much shorter than the wavelength of the measured RF signal (which may be as long as 160 m in some ham applications)

Here comes a picture:

```
Main line ----------------------------------------------------------

Second line ------------------------
| |
--- ---
| | | V | AC voltmeter
Anti-reflection | | ---
resistor | | |
| | |
--- |
|
|
```

According to what I have read this is a directional wattmeter: the reading of the voltmeter depends only on the amount of power going through the main line from left to right; the power which goes from right to left has no effect on the measurement.

Therefore, depending on the direction in which you connect this device, you can measure separately the power sent from transmitter to antenna or the power reflected back. With two devices like this, you can directly read the SWR.

This is magic.

I don't understand why and how it works.

Can somebody explain ?

Thanks in advance,

Marcin.

Transmission Lines by Johnson, Walter C. has a good explanation...p.190.

He says that the resistor is some value between the two extremes of infinity and zero and that the probe responds to both voltage and current. He also says that the backward traveling wave has the phase of it's CURRENT reversed and this reversed signal can be used to cancel the one obtained from the backward traveling VOLTAGE.

So he writes: Ecoupler = C1*E + C2*I where E and I are the voltage and current of the main line , and C1 and C2 are constants.

E = (E+) + (E-) and I = (E+)/Zo - (E-)/Zo and then

Ecoupler = C1*[(E+) + (E-)] + C2*[(E+)/Zo - (E-)/Zo]

If you adjust the coupling so that C1 = C2/Zo, the two terms containing (E-) will cancel leaving only

Ecoupler = 2*C1*(E+)

then the coupler responds only to waves traveling in one direction.

I know this will take a little soaking in but it is all you need to reveal the magic.

What would be a cheap, good SWR meter for 2m and 70cm? I was looking at
getting the MFJ-862 for $50.
Would the 862 be the best choice to use with a dual-band HT?

Please reply via e-mail.

Thank you,

CraigIvey@aol.com

Talk through a kazoo and tell people it's "FM single-sideband." If you do it
on ordinary SSB it will drive receiver operators nuts.

: repair shop I'd appreciate the information

: Thanks, Dick - K5QY

The FT-1000s after lot 28 (27?) have improved pin diodes in the RF unit.
This, Im told, will improve the 2nd order IMD. Yaesu will perform this mod.
Last I heard they did the mod free but then charged to realign the receiver
after the mod.

Derrick:
I own a Heil headset with boom mike and I would recommend it. It is
by far the best headset I ever had and the mike is very good for dx
and vhf work. I use it mainly on AO-13 and it works very well with a
ICOM IC-970.
However you should be aware that the audio output is fairly low. For
most transceivers you would need a small preamplifier. (For instance
on my IC-781 the mike voltage is too low). Such a preamp is easily
built.
The advantage of the headset is that it is light, fits very well and
I can wear it for hours on end (which is not true with most other
headsets).

171. FT-736R direct frequency input/mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-03 00:00:00 UTC
From: jimf@zoinks.corp.sgi.com
Message-ID: <4req2a$t00@murrow.corp.sgi.com>
Source record: 198499

Hi,

I have included below what I have found on expanding the frequncy range of the 736R. Evidently the mods do work and I have been able to confirm some of the operation of them. But the second paragraph states that when operating the 2m module you can directly enter any frequency from "110 to 200 MHz". Now I've tried and tried, but I just can't get it to go. What I see, and what the manual states is that the ones digit is the default first digit presented for direct entry. This makes sense if the radio is to only be operated from 144 - 148 MHz (U.S. version), because 14X.XXX covers everything intended.

So how is it done otherwise?

Note: I'm actually trying to get the mod to work on 6m so I can listen for video below/above band for sporadic E openings, and 420 - 430 so I can see what's up down in the ATV area if any.

Begin included file from ftp://oak.oakland.edu/pub/hamradio/mods/yaesu/ft736r.mod

Fm: Chuck Scott N8DNX

You can modify the 2 Meter section for 141-154 MHZ by adding D27
(not installed in USA version). This is normally soldered to the
board but you can easily install it by simply shoving the leads into
the connector. The 2 Meter section is the middle board looking into
the radio from the top. The connector (J09) is the large one on the
right side of the board, half way back. You want the cathode (striped
end) of a small signal diode in pin 7 and the anode in pin 4. Pin 1
is toward the front of the radio.
To receive over a slightly wider range, place the SAT switch in RX mode,
press ENT[D] then enter a desired frequency and press ENT[D] again. You can
enter any frequency from 100 to 200 MHz this way. Unfortunately, the
synthesizer does not actually cover that range. As far as I can tell the
bottom end is about 138.5 (not quite the 136.5 needed for the weather sats).
The top end is about 155.6. You can't perform this stunt with the normal
(non-satellite) VFO's. Also, once a frequency is entered in this way, it is
possible to tune toward the normal range but tuning away will place you back
in the 141-154 range. Using the same method yields aprox 220.0-229.5 &
423.0-454. You may store these frequencies in the SAT Memories.

I've read here on the net that doing the wideband TX mod
provides transmit pretty much everywhere that the radio receives
albeit on a few milliwatts in certain ranges.
Mine will not go into TX mode outside of HF thru 54 MHz and
138 to 174 MHz. Did I miss something about the mod ?
From what I understand it should transmit but only put out an
order of a few milliwatts.

Thanks

173. Kenwood TR-7930?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-03 00:00:00 UTC
From: 5leitgeb_c@spcvxb.spc.edu
Message-ID: <1996Jul3.163005.1@spcvxb.spc.edu>
Source record: 198501

I recently acquired a Kenwood TR-7930 2m radio in a trade,
and I have a few questions about it. First, how old is this radio,
when was it introduced/discontinued? Anyone still use this radio,
and if so, how do you like it?
One problem I have with this radio is the TU-79 tone board
installed in it. It's only capable of doing three tones at a time,
and the tones are set by cutting diodes on the tone board itself,
according to the users manual. Does Kenwood, or anyone else for
that matter, carry a replacement tone board capable of doing all
the tones? Finally, are there any modifications to extend the receive
on this rig? I guess I'm spoiled by the extended receive on most
newer 2m radios!
Any help would be appreciated.

As I recall, the HT40 had a "screen modulator" for AM in it. This was
the little novice transmitter with crystal control as I recall.
I'd suggest that you look inside and see if there are a couple of tubes
NOT in the RF path, possibly a 6AQ5 and maybe a 12AX7 (or equivalent).
If those are there it has the modulator. Should be easy to figure out
where the mic. goes and where the mic. gain is located.
If it does not, and requires an external modulator, you will likely have
to home-brew one. Old ARRL handbooks fron the late 50's and early 60's
should have info on the screen modulators.

The manual is interesting in that it explains the theory of the design
of the meter and has charts showing the swr based on the readings of the
forward and the reflected power. I like to have the manuals of the
instruments that I have (or don't have). There is often a lot of
information that you wouldn't think to ask about.

There is a complex front panel keystroke method of receiving out of band
by using the PMS (Programmable MEmeory Scan) feature. I use it to
listen for Es video outside of 6m on my 736.
Look around on the FTP sites again...The expanded RX 'mod' came from a
couple of guys in the UK.

Cheers...

Is the Yaesu FT-736r transciever capable of cross band repeat ?
I'd like to be able to listen in on 52.525 MHz and various other
parts of 6 meters using my 2 meter HT in the backyard !

Thanks...
Hugh Duff VA3TO Toronto

Isn't there a law regarding "Equal force" IE if the burglar has a big
stick, you would be able to defend yourself with something similar.

I was once told of a man who had beaten a burglar to a pulp with a
poker, er... defending himself, the first (old) bobby on the scene asked
the householder where the other weapon was, he tried to say that there
wasn't one, the cop quickly said, "yes there is sir, you just told me,
don't you remember? Have a good look around, I am sure it will turn up!"

Not exactly legal, but surely you *should* be able to have a go at
someone in your own property! I think I would probably risk it.

Source record: 198557
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

It is almost funny - one of the most accurate and reliable
sources of Amateur Radio information <satirical comment about
you know who!> - posts a note with comments about Kenwood
sales practices and Microsoft and the computer
industry allegedly trying to grab Amateur Radio bands -
and most everyone takes his word for it!

Even funnier is that information refuting most of these
claims is easily available right here on the Internet.
To refute allegations that Teledesic is
one of the LEO's trying to "take over" the Amateur bands,
I spent all of about 5 minutes using DEC's AltaVista search
engine. Here is some of what I found.

1. The Teledesic Press Release
You can read the original press release form Teledesic announcing
their plans for a "Big LEO" high speed data network based on
840 orbitting satellites. According to the story, cellular phone
pioneer Craig McCaw, and Microsoft founder Bill Gates, made founding
investments in Teledesic. In both cases, these investments were made
by the individuals and are not connected to either McCaw's cellular/SMR
properties nor Bill Gates' Microsoft Corporation. McCaw and Gates
made personal investments as founding investors in Teledesic.

You can read the press release:
http://www.att.com/press/0394/940321.pca.html

2. Teledesic is using frequencies at 19 GHz and 29 GHz.
Teledesic is a "Big LEO" operation, not a "Little LEO" - the
"Little LEO" companies are the ones who wish to consider use
of the Amateur allocations for their 2-way messaging systems.. You
can read about the frequencies that were allocated to Teledesic at:
http://techweb.cmp.com/techweb/cwi/current/155news1.html

3. FCC Documents
You can read at least one of the related FCC documents concerning
Big LEOs online at: http://www.fcc.gov/Bureaus/Wireless/Notices/fcc95287.txt

4. Bill Frezza's article comparing Big and Little LEOs
Bill Frezza is formerly a marketing manager at Ericsson; former
President of the Personal Computer and Communications Association;
and current wireless industry consultant and pundit, writing columns
for several publications. You can read his column on Teledesic at:
http://techweb.cmp.com/techweb/nc/615/615frezza.html

And now, shame on those of you who bought you-know-who's silliness hook, line and sinker and didn't bother to even make a modest effort to check his wild allegations.

Don't you just hate it when somebody comes along and spoils the fun with some actual facts?

I got one onf these and a Standard C508. The 508 is more cute according
to my wife, but the FT50 has a much better receiver especially
470-500MHz where the 508 is deaf. I get much more image freqs on
the 508 which receives 485 MHz better when tuned around 940MHz.
The mod removing solder pad #1 gives tx 140-174, 420-470

It's funny that this thread should pop up now. In the new summer blockbuster "Independence Day," almost every major city and military base gets blown up by malevolent space aliens. The military forces of the Earth end up using CW because it's all they have left (no satellites, tons of RF interference, etc...). In fact, CW ends up saving the day. OOPS!! I said too much. Good flick, BTW. Well worth the $5.00.

I heard a conversation between an station in NJ and one in Germany talking about the new Kenwood TS960. A new HF receiver with features between the 950 and the 870. They said a number of units were in the states going through a show/tell shakedown and that the product would be introduced shortly at a ham-convention in Denmark.

Anybody hear tell of such, and what is the 960? Also kinda dispells any negative confidence factor Kenwood has in the marketplace.

That's what I'm hoping for too. I like the FT-8500, but want something
like a FT-9000 which is a FT-8500 with FT-3000 features. Then I can get an
Alinco DX-70T for HF and 6M and have everything I want.

Glad to have bumped into you. I have a question about the MFJ unit.
Since my rig has a preset side tone for CW (only adjustable with the
covers off and a board unscrewed) I want to know if you are able to set
the center frequency (in cw mode-peak) exactly on the side tone or are
the steps so wide that you're off the mark by 10 or 20 hz or more? Does
the fact that there is a slight delay "throw you off" when your sending
cw?

I needed a battery pack for an old Tempo S-1, posted an inquiry here,
and got several referrals to W & W.

I called, got a good price (better than Henry used to be - years ago),
and good service.

There are probably other sources, but these guys were certainly good
enough.

I operate mostly cw. A couple of years ago I bought a NIR-10 dsp unit. It worked well but could not keep up with fast keying and qsk. I took it back for a refund. Recently I bought the MFJ 784b. I was amazed! With no keying connections, just putting it in series with the speaker, it follows keying perfectly beyond 40wpm. My qsk in the OMNI 6 works as well or even better than normal with the MFJ. I feel that the MFJ offers maximum versatility at the lowest cost. Also, I really like the AGC feature. You can turn off the agc in the rig, crank up the af gain, reduce the rf gain then turn on the agc in the MFJ and let it fly....No matter how loud the signal is, your ears wont be blasted and there is no distortion like the old limiter systems used to have.

> 73 de KJ5WA

Well, I made a super crude one 35 years ago. As I recall, this is
what I did.

The razor blade was mounted to a piece of plexiglass with two screws
and nuts.

A large safety pin was modified by cutting off the 'hook end' and
mounted to the plexiglass with a screw through the loop of the safety
pin. It was bent so it could contact the razor blade.

Now, the crude part...

The headphones were hooked between the safety pin and the blade. As I
recall I also had a couple short pieces of wire, one on each side of
the head phone wires.

At the time I could plainly hear two local radio stations (WMT and
KCRG). There was no tuning. I was located eight or ten miles away
from these stations.

I even was able to work another ham a block away. He was on CW and I
could copy him fine (but no beat note).

My headphones were probably high impedance (20,000 ohm?). The were
the kind with magnets and coils (not crystal).

Anyhow, there were no coils, resistors, or capacitors. And the safety
pin was not all that difficult to adjust and stayed put for a long
time.

Hope this helps.

73, John W0GN

So with the software method, does the unit receive 220 MHz too?
Also, does anyone know what jumpers 2 and 3 under the keypad are for?
AND, is the TouchTone decode into autodial channel 9 suppose to
work without the Ftt-12 pad? Icouldn't get mine to register any numbers.

Does anyone know when ADMS will be available for the FT3000M?

I know that Yaesu says on their homepage that it would be available in May 1996, but AES told me today that they aren't even allowed to order it yet.

Thanks,

Bob

Description of device deleted...

>
>This is magic.

Aye, magic it is! The equivalent microwave device is even called
a 'magic T'. What you described would commonly be called a
directional coupler, but the idea is the same.

Consider that the parallel lines are also coupled capacitively.
For power flowing in one direction, the capacitive and inductive
coupling add, while for the other direction, they subtract.

The trick is to get the coupling just right, so that the
undesired signal is cancelled exactly. (40dB of suppression is
considered fair, generally.)

From: Gary Wilburn <ni8k@one.net>
Message-ID: <31DB4554.2961@one.net>
Source record: 198431

Hello:
Have the FT 50R and the ADMS-1c software. Everything is just fine and all the mods work fine !
1. Removing the bead of solder from point or pad number 1 opens up transmitt for 123 to 221 mhz and 320-499 mhz. How well it works on these other frequencies in your part of the world needs to be tested.
2. Receiving 869-894 mhz can be accomplished with the ADMS-1C software or any other software that will allow communications with the 50R and your computer. The part you need if you do not have the ADMS-1C is the interface that connects the 50R to the computer. This "connector" has a female 9 pin 232 plug on one end and a 1/8 in stereo like plug on the other but instead of 3 sections on the end it has 4 sections to connect to the radio.(pictured in the manual)(not a standard Rat Shack part !)
When you are connected try this. Download info from the 50R to the computer. While communicating pull the plug out of the 50R. This will probably lock up the 50R. Turn the radio off then on. Check by entering 870.000 mhz. If it accepts that frequency you are set ! If not, try it again. It took 2 or 3 try's for me to get it. One time I even uploaded files to the FT 50R. All I know is that, uploading or downloading information then pulling the plug on the 50R switched the main chip to the European mode.
When you open 869-894 you have reset the main chip to act like it is in Europe. One problem - if you have not done the wideband transmitt mod you will not be able to transmitt above 146 or 442 mhz which is standard for VHF/UHF gear in Europe. So, do the wideband mod first !
The ADMS-1C is windows based software that I think is worth the $40.00. It also includes the interface. I purchased mine from RT Systems at 1-800-723-6922 or 1-205-882-9292 in Huntsville, Alabama. I believe they make the software and interface for Yaesu.
I don't own the company-they were just nice and helpfull over the phone.

>If so, where did you mount the main unit?

I'm not familiar with the 706, but I assume it's a "remote head" type rig. I mounted the control head of my Alinco 590 to the ashtray.
You'd think a vehicle the size of the Jeep GC would have a lot of places to mount a radio, but that was the only acceptable place for me.

Source record: 198435

Joe,

Sorry, I lost you original posting and Netscape locked up as I was posting the reply. Here's what I managed to copy to the Windows clipboard:

I have tried the Timewave DSP-9, DSP-9+, The Radioshack unit and the JPS NIR-12.

The NIR-12 is a clear winner. It is able to reduce noise the others can't and I like the continously variable bandwidth. I have two complaints about the unit: the headphone connector is on the rear of the box and so is the dynamic peak level switch. The latter I can live with, but the former means I have to do some surgery to the box. I don't like doing that to a new piece of equipment.

I used the unit during last week-end's Canada Day contest and it helped me a lot.

I use the NIR-12 mostly for SSB, but it works fine for CW as well, however, the DSP-9+ is also good for CW. It certainly is able to reduce white noise and provide great selectivity. The DSP-9+ has one advantage over the others: an audio AGC which can help under some conditions. Just keep in mind that it amplifies the noise in the breaks between voice activity. The DSP-9+ has fixed filter that you can select with pushbuttons. I found that I usually left it in the wide position most of the time. The narrow setting (1.8 KHz bandwidth) tends to cut the understanding of many stations.

The RS unit does not really do any noise reduction, but it does narrow the bandwidth which is often enough on CW. I found it quite adequate on CW, but useless on SSB.

A good DSP makes HF listening a real pleasure. I find that I leave my HF stations on a lot more and that I do not get tired from listening to it. The NIR-12 can be set to reduce the background noise so much that it almost works like a squelch.

I would never operate HF without a DSP again.

These are high impedance headphones. Surplus (from WWII?) would be fine,
or else insert a small transistor transformer with a hi-impedance to
low impedance windings if you want to use modern "earplugs", but this is
getting a bit complicated. Enjoy.

KC7QZR needs to learn how to spell "Mobile". "Mobil" is a petroleum company.
Although, I suppose, they could branch into new markets (I don't know if they
still have a stake in Montgomery Wards or not after the Jefferson/Jefferson Wards
debacle (A whole new slant on shopping - unstocked shelves because we fired
our buyers....8)))

>">have any kind of swr meter or anything but my radio which will let me
>">know when its pumping out full power...

i guess one would want to get the most from any radio transmitter, but that
phrase about "pumping out full power" is very "CBish" - sounds like maybe
a refugee from the CB bands that hasn't been exposed to the idea that some
people actually have radios used for bidirectional communications instead of just
trying to "cover everyone up".

>"You can make a whip from just a 19 inch length of wire and a coax

good answer -- tell the guy what he needs to know - i think my answer was
a pointer to the arrl handbook...

> Just a second...
>When we took the Ham test didn't we have to show that we could figure
>frequency to wave length?

it's in the study materials, although it's possible to pass the test without
having that exact question either on the test or answering it correctly.

>I don't want to flame anyone but it was a basic fact of radio,, I thought.

it is..

> Dean WB0TKC

but like last night on one of the VHF nets i was on, we had a guy that
was on the air but didn't know what his call was...turned out he'd acquired a
radio from someone else and was told it was a CB radio. we told him what he

really had and what he should do to get legal and then went back to the net.

it sounds like KC7QZR could use an elmer and additional reference materials.

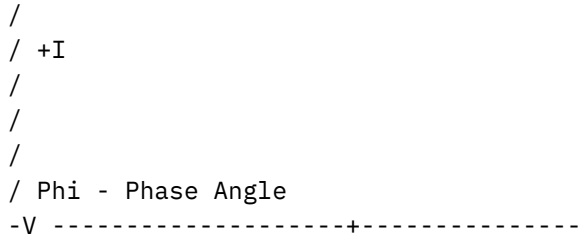
>the magic.

Something else that might help is a vector diagram. Let's say we have a voltage vector proportional to the transmission voltage and another voltage vector proportional to the transmission line current. When there are no reflections, these two vectors are adjusted (calibrated) to be equal in magnitude and phase referenced to the Z0 of the line. Then either with reflections (out of phase V and I) or without reflections (in phase V and I) the following holds:

V(i) (vector add) V(v) is proportional to the forward power and

V(i) (vector sub) V(v) is proportional to the reflected power.



Let's say we have 10v proportional to the voltage and 10v proportional to the current and are generating 100w. The following would be true.

For Z0=50 ohms, V(v)=10v is proportional to 71 volts on the line
V(i)=10v is proportional to 1.4 amps on the line

For Z0=75 ohms, V(v)=10v is proportional to 87 volts on the line
V(i)=10v is proportional to 1.15 amps on the line

For Z0=300 ohms, V(v)=10v is proportional to 173 volts on the line
V(i)=10v is proportional to 0.58 amps on the line

For Z0=450 ohms, V(v)=10v is proportional to 212 volts on the line
V(i)=10v is proportional to 0.47 amps on the line

That's why an SWR meter calibrated for 50 ohms needs to be recalibrated to work with 75 ohm line.

Well, I *was* looking into possibly starting a hobby out of HAM.
But judging by these past 2 posts, one by Bill Newkirk WB9IVR, I see that
the attitudes and childishness isn't lmited to the people on "CB" Radios.
Perhaps HAM isn't for me after all, if Bill is any indication of the
types of people that are out there.
Oh, and by the way, Bill - while you were busy slamming this
other guy for his spelling, I noticed YOU need a few grammar lessons as
well, things that were learned in Elementary School.... such as when you
end a sentence while quoting, the period goes inside the quotes, not
outside. Also you seem to have forgotten to end a sentence or two with a
period. Hmm. Seems you aren't the perfect God-almighty after all.
I was told that if a person needed a question answered or some
kind of help, that other HAM operators were happy to help out, and that
the operators of HAM radios were like a family. But what I've just seen
sounds like Channel 19 at a truck stop. No doubt I'll receive a bunch of
childish ranting and raving, cussing, etc in my mail box, so until
then... Ciao!

Hi Gary, what you say is surely correct (at least theoretically)
but does confirm my worries: In an typical crowded amateur band
establishing QSO's is a far greater activity than the few rag-chewers.

Clover is for two reasons not too well adapted to amateur radio:
The transmitter must be very linear, else the QRM by intermods will be
horrendous (with 4 carriers in the 500 Hz window), secondly the protocoll
is optimized for conveying large amounts of text, and not the usual
bits and pieces.

It is claimed that digital modes or CCW can filter out signal from noise
that else could not even be heard. Does not sound like it would work for
random calls too well? And untill EME-QSO's in CCW or Clover using only
1 Kw EIRP are commonplace, the claim of superiority remains a theoretical
prediction.

Actually a 19" piece of coat hanger just looks "black" and doesn't
attract to much attention, except as an antenna.
Twenty years ago, I was having Mosley 5/8 wave 2 meter antennas
stolen off of my car regularly (they looked a lot like CB antennas, and
this was in the middle of the CB craze). So I made a 1/4 wave antenna
from a coat hanger and put it on the car.
A month or so passed. Then, there was a rash of car break-ins,
and *my* car was broken into. My ICOM IC-22A (2 meter rig) was stolen.
And yes... they stole the coat hanger antenna, also.

BTW... after this (and the insurance paid off) I got a new 2 meter
rig and a Hustler colinear antenna. It was never stolen.

>an anti-corrosion nickel overplate. That's what commercial whips

I've used stainless steel welding rods, but even they tend to
deform a bit too readily.

> the $5.00.

I saw the movie last evening - great fun! Should be a real winner. And yes, CW *does* play a key role. Without giving away too much, at one point in the movie they were short of fighter pilots, but there seemed to be no shortage of CW operators and a secret Air Force base!. I'd bet in real life it would be the other way around.

245. FS: HP 1740A 100Mhz Oscilloscope

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-04 00:00:00 UTC
From: Dan Ellefson <sl3jj@cc.usu.edu>
Message-ID: <31DC295A.1097@cc.usu.edu>
Source record: 198463

FOR SALE: HEWLETT PACKARD 1740A ANALOG 100Mhz OSCILLOSCOPE

The unit is a two channel 100 Mhz oscilloscope with two external triggers.
It comes with two HP X10 probes that came with the scope and two B&K X10/X1 probes
that I bought brand new. All the probes are rated at 100 Mhz. The scope is capable
of deflection factors from 1 mV/div to 20 V/div on the vertical scale and 5 ns/div to
20 s/div on the horizontal scale. The scope also has a delayed sweep feature which is
set by a precision control knob which allows delay settings of 50 ns to 20 s. Other
features of the 1740A include simultanous display of both input channels and the trigger,
bandwidth limit control for attenuation of signals above 20 Mhz, plotting channel A vs B,
choice of 50 Ohm or 1 Megohm input impedance, Chop mode, Alt mode, A+B display, channel
B inversion (this allows A-B display), trigger selction of channel A, B, or external,
trigger level control,LF and HF reject on external trigger inputs, AC, DC, Internal and
External triggering, External /10 triggering, and many more features.
Documentation for the scope is included and consists of the 1740A Operator's Guide
and the 1740A Operating and Service Manual with includes detailed schematics of the scope's
internal circuitry.
The scope comes with a soft leather pouch with a velcro closure that is attached
to the top of the unit allowing storage of manuals and probes. A hard plastic cover is
also included that fits snugly over the front face of the scope to protect the controls
and CRT.
The scope is in very good condition with no noticable dents or scratches. I've had
the scope for quite some time and have been very pleased with its performance and the great
many features that come with it. The reason that I am parting with it is because I recently
purchased a brand new $4500 scope (ouch....) and have no need for two scopes.

PRICE: $495 (buyer pays for shipping)

I completed your circuit, to complete the directional wattmeter we must add a connection to ground and a capacitance to the center conductor.

Add one of these to each end of the top conductor. Now the top conductor has two voltages imposed on it: one from the inductive coupling due to the current in the main line center conductor and the second from the capacitive coupling due to the voltage on the main line center conductor.

Power flow in different directions results in current in opposite directions, but voltage is just voltage. So for one of these directions the currrent and voltage effects will sum and for the other they will differ. Adjust the capacitance for a good null under the difference condition and you will then have double the output when they sum. Scale the meter to get rid of the 2x difference. Of course this only works for a given I/V ratio, but this is just a transmission line of some chosen, fixed impedance.

Voila', you have a directional wattmeter good for a 50 Ohm line, or whatever line you chose.

251. NEED INFO: ICOM IC4SAT Keyboard entry mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-05 00:00:00 UTC
From: mbtindor@ns2.harborcom.net
Message-ID: <4rhvbp$1qm@bad-news.harborcom.net>
Source record: 198378

Hi & thanks for reading this message!

I have an ICOM IC-4SAT handheld. This handheld, after internal modification, has extended receiver capabilities as well as (with another internal mod) extended transmit capability.

I have performed the receive mod (have no use for xmit mod) and would like to have all the 'undocumented, or documented but not well known' keyboard entry mods to all it to be more useful.

I have found all kidns of info on the IC-2SAT (and was told that the processor is basically the same as is in the 2SAT), but I believe that the IC4SAT has a few different commands to activate other functions than does the IC2SAT.

I used to have a very in depth file with all the information specifically for an IC4SAT but lost it when the hard drive carshed. I now would like to have that info again.

IF you have any info SPECIFICALLY FOR the IC-4SAT handheld, please send it to me in e-mail. I would greatly appreciate it.

Thanks in advance for your help.

Mike

Jeff,

I bought an ADI AT-18 2M portable. The radio is almost identical to a Standard model. The rig itself is functions fine. They are not as rugged as a Yaesu. I have broken all the original battery packs. One melted, the other was dropped.

If it were a mobile rig. I can't help but think it would be fine. No battery back, and you can't drop it very easy.

Source record: 198383

I recently obtained an old Kenwood R-599 Receiver (along with its twin HF transmitter). The receiver has a 144 Mhz add-on. It all works great, except I can't figure out how to determine the 2 M frequency I'm monitoring. The Receiver has a 144Mhz "A" and "B" selection switch which works in conjuction with the HF Band selection switch to get to different frequencies. I don't have the manual for the 144 Mhz module. Can anyone explain how to determine the receive frequency for this unit?

Thanks Much,
Roy - KB0WTF@AMSAT.ORG

257. Yaesu HM29AB Speaker Mike Programming

I bought a used FT530 with the nice speaker mike, but there was no manual for the speaker mike. How do you program the user programmable button? Currently it is set to the (default) band switch function.

Thanks for any help.

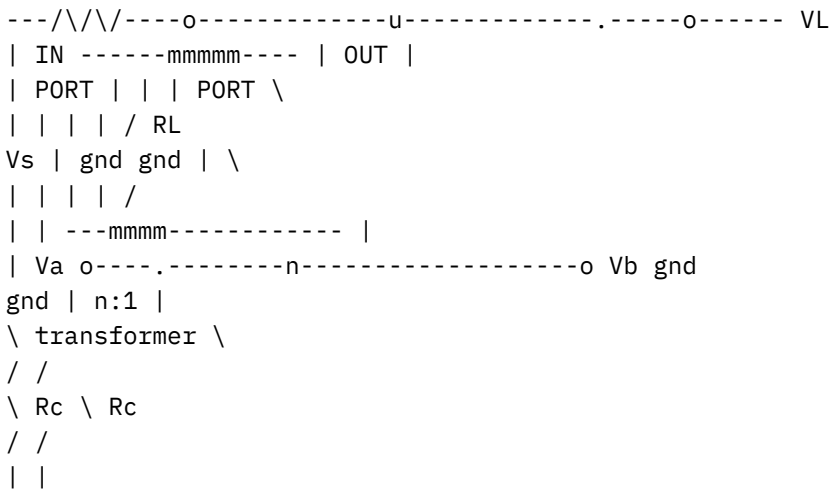
Sometime ago I had the same problem as Marcin - I wanted to understand how an SWR bridge's directional coupler worked, and the only explanations that I could find described its operation in terms of the forward and reflected waves. I had two problems with these explanations:

1. The directional coupler that I wanted to understand was a "lumped-element" not "distributed-element" circuit. That is, essentially it sampled the voltage and currents at one point along the transmission line, and I couldn't understand how one could seperate out the forward and reflected waves by just looking at one point. For me it was equivalent to standing at the seashore and watching the ocean swell - if you just look at one point, you see the water moving up and down as the wave swell passes, but you can't tell the direction of its motion.

2. Also, the directional coupler still operated correctly when a load was connected *directly* to its Antenna port. In this configuration my generator, directional coupler, and load were all attached with very short wires, in essence a "lumped-element" circuit (everything very short compared to the wavelength of the signal). One doesn't usually think of a circuit like this in terms of forward and reflected waves. Instead, you describe it's operation with classical circuit analysis techniques. Realizing this, I sat down to puzzle its operation out, and this is what I came up with:

The direction coupler circuit I analyzed was:



gnd gnd

In this circuit Va and Vb are the two sampling ports, and the value of Rc is set to equal that of the transmission line's characteristic impedance.

From this circuit I derived the following equations (for ease of derivation I assumed a resistive load only):

Vb = (Vs/(2n)((Rc - RL)/(Rs + RL))

Va = (Vs/2n))((Rc + RL)/(Rs + RL))

Note that nothing in these equations mentions forward or reflected waves. However, if you compare them with the standard transmission line equations, their forms are similar.

For example, let's set Va equal to 1 and do some equation substitution. We can derive:

Vb = (Rc - RL)/(Rc + RL)

This looks suspiciously like the equation for the reflection coefficient (well, the negative of it)! We do the equivalent of this derivation when we adjust our SWR meters for full-scale reading in the "forward" direction (that is, set Va = 1), and then read the SWR in the "reflected" position (measure Vb in the above equation).

Marcin drew a different directional coupler circuit in his post - it's a circuit found in many inexpensive SWR meters. I'll contend that one can do a similar analysis on this circuit: after all, if I place it on my work bench in a "lumped-element" circuit configuration, it still functions properly. Therefore one should be able to analyze it's operation with standard circuit analysis techniques in a fashion similar to what I did above. In Marcin's particular circuit, the parallel wires provide both inductive and capacitive coupling, and I would argue that the resistor is not an "anti-reflection" absorbing resistor. Instead, it's function should be explainable in terms of a lumped-element circuit where there are no reflections and where the term "anti-reflection" has no place.

Cheers,

- Jeff, WA6AHL

hello everybody, here is BD7IX(Lu Hui-Hua) from P.R.CHINA.
somedays ago, i send a mail at here , said want to know how
to made a modem(tnc) myself, my plan is use TCM3105 or
AM7910(7911) chip to do it, but unfortunate, the chip is
not produce. soi think maybe motorola's MC145442 OR MC145443
can replace it. but mc145442(3) only can use 300 baud
(CCITT V.21 OR BELL 103).
who can tell me the alternative else?
and if i use MC145442(3), who can give the circuit design about it?
please tell me via e-mail bd7ix@amsat.org
thanks

Lu Hui-Hua*bd7ix*

didn't say i was. and welcome to deconstructionist typography. i do have damon
knight's treatment on grammar from GEnie that is a super reference for only a
few typewritten pages - at least it addresses the common errors and mis-
conceptions most people make.

and this is news - not english class. they'd take points off for not capitalizing
the first word of a sentence. can't say there's a hard and fast rule about trailing
punctuation inside of quotes these days. depends on the usage to some extent.
i suppose you think that there should be two spaces after a period. although that's
something you did with typewriters and not when you have proportional fonts
available.

> I was told that if a person needed a question answered or some

>sounds like Channel 19 at a truck stop. No doubt I'll receive a bunch of
>childish ranting and raving, cussing, etc in my mail box, so until
>then... Ciao!

oh, come now. the guy claims a ham license. therefore, it's expected that he knows something about where the information is located about such things as how to build a simple 1/4-wave whip for 2m. but even if he hadn't known that (as i said, you can pass the test without understanding c=f<lambda>), the fact that the lingo is out of whack indicates that our new KC7 needs further orientation.

remember the object is not to "pump out the most power" but to communicate. and if you actually read up above there, we did tell our bootlegging friend on wednesday that he should consider getting license and he would be welcome, but until then he should just listen and not transmit. in that respect, we were correct in that we advised an illegal station to stop being an illegal station and to get the license and be legal. for that, we run the risk of a citation ourselves (for communicating with an unlicensed station).

i don't think that's a sign of someone not wanting to help. however, things such as some misspellings probably comes from having Dr. Moench at Rose as a mentor ("A -rotor- is the part of a motor that moves. A -rotator- is the device that turns the antenna!").

>This is magic.
>
>I don't understand why and how it works.
>
>Can somebody explain ?

Let me add a very simplicistic picture to the maths presentet so far:

The wave traveling down the main line induces a (weaker) wave
in the coupling line. Both travel the same way, because contributions
coupled into the coupling line at different points and travellint in reverse
direction cancel (destructive interference). So if one end of the coupling
line is terminated properly and the other is fitted with a detector, there you
are.

The lumped element indicator probes the voltage and the current at one
point of the line and compares them. Now the current is in phase for
the foreward going wave and out of phase for the backward moving wave.
(That's what makes the waves move). If you add the detected
current and voltage signals, you see only a signal from the outgoing wave.

Why is the current out of phase for the reflected wave?
because else it would not be moving backwards.

No, my comment on the punctuation was merely to make a point.
You made several snide (sp?) remarks to him, one of which was making him look ignorant because of his spelling. I was simply trying to point out that while his spelling was being insulted by you, your punctuation was bad. No, it's no big deal, but I was trying to say was it didn't make sense to insult him for his writing/spelling style when yours had its faults too. None of us is perfect.
As for the antenna, perhaps he's just a buff who likes to receive only, not transmit, and doesn't have a liscence yet. The handbook does say that's perfectly legal. Maybe he wants to see what's "out there" before getting into the hobby?
I myself am in that position. However, I'm quickly learning that HAM operators aren't the type of people I had heard they are. This fool Myron Calhoun took it on himself to write me an ignorant insulting letter, implying that newcomers are welcome but if they have any questions that they are NOT welcome to ask them and that any information they get is to be obtained solely on their own.
He ALSO commenced to make a weak attempt at hurling insults at me for asking such a "stupid" question about antenna/wave length. What the old fool didn't take time to do is see who asked the question. That was not me, yet he is going to write me and slam me for it.
Myron challenged my "maturity..." I have yet to figure out where he comes off with that. Even if I HAD asked the question about the antenna and wave length, how does that make someone immature?

Look... I was told HAM operators welcome new comers with open arms and are always happy to help someone else get started in the hobby. I was looking in to it on my own and discovered that there are many ways to go (2M, 6M, 10M, etc) and wasn't sure which way to go. I haven't asked though, because anytime someone asks a question like that, he receives nothing but rude replies and remarks. I haven't asked PUBLICLY that is... I've had the fortune of finding ONE friendly ham though.
I was also told to start going into the amateur (look up the definition for amateur by the way) newsgroups and that I could start participating and asking questions there to help learn. Boy, were they wrong. New HAM operators, or prospects, are treated rudely and insulted... not what I would call a warm welcome.
My apologies to everyone here. I was foolish in believing such an ignorant thing... Don't bother replying publicly, nor in e-mail.
When I post this, I am going to unsubscribe from the asshole, er, amateur radio newsgroups - email will be erased without being read if it's from the newsgroups... don't bother. And don't bother ME.

Hi RWC.

I would like to offer an explaination. It seems the internet can bring out the worst in people. Many come here just to flame and attack. I dont know why it is, perhaps its the anonymity of being behind the keyboard, or something else, but I DO know its basically true in most groups...not just ham radio ones.

There are those who do these types of things reguarly, like Burt, Gerry, Drew and others, as nothing more than to cause trouble. While even I have been sucked into petty flame wars, I think its safe to say that most of us do NOT condon, or support the likes of the above mentioned.

What you heard about hams helping others that want to join is true of most of us. All I will ask, is that you dont base your entire opinion about amatuer radio, by what you hear here.

I would also like to offer any insight, help, suggestion, or anything else you may want, regarding amateur radio.

Take care.

A DSP in the audio stages also won't prevent an interferring signal from
"pumping" the AGC and reducing your receiver sensitivity. That can
cause loss of the desired signal if it is weak enough.

270. Kenwood TM-733 Airband Rx fault ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-05 00:00:00 UTC
From: Nick Button <nick@plains.demon.co.uk>
Message-ID: <836611546snx@plains.demon.co.uk>
Source record: 198397
Cross-posted to: rec.radio.amateur.equipment,uk.radio.amateur

I have a Tm733E with the wideband receive enabled. I've had it for a year now but recently I discovered what may/may not be a fault or a deliberate block by kenwood...

The airband RX will not rx anything between 130 MHz and 132 MHz, however it does apparently tune through the range without a drop in noise level.

Strangely enough this corresponds to the "company operations" frequency section in the VHF airband, so I was wondering if there may be restrictions on this in the US as the American model also has the 800MHz receive module omitted.

I 've asked another ham locally to try his and see what happens, but I'd be interested to know if anyone has noticed this "gap". On the other hand if it is a fault I shall be sending it back to my dealer under warranty !

274. Why a Bird Wattmeter ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-05 00:00:00 UTC
From: tim_shearer@mk.com
Message-ID: <4rjqhg$b03@esgadm.esg.mk.com>
Source record: 198401

Why do I need a Bird wattmeter ??
Why would I want to spend $500+ ??

These wattmeters must have some characteristics not
generally understood by most persons. They are only listed
as having about 5% accuracy, yet they cost a lot and still
require at least a couple $50 slugs to be useful!

The internals of these consist of a precise heavily cast
coaxial section which calibrated slugs fit into...

Does this construction give the wattmeter advantages
over much cheaper stripline instruments...such as
immunity to high electric field levels around the meter?

Are the many various range slugs...required due to
the characteristics of the cast coaxial section?
Cheaper wattmeters cover a much greater range!

My applications include home use of course but primarily in the
maintenance of a repeater system. Any of advice about metering
practice would be appreciated when dealing with all the
connections in and out of duplexers and amplifiers, etc.

Thanks

Tim

Depends on how much money you have. If I ever win
the power ball lottery, I'll probably get one. Until then,
there are too many other things I can use more.

>These wattmeters must have some characteristics not
>generally understood by most persons. They are only listed
>as having about 5% accuracy, yet they cost a lot and still
>require at least a couple $50 slugs to be useful!

They are ruggedly made and flexible in that there are many slugs
available so they can cover a wide range of frequencies and
power levels. They are 'thru line', so you can simply rotate the slug
180 degrees and check reflected power.

>The internals of these consist of a precise heavily cast
>coaxial section which calibrated slugs fit into...

> Does this construction give the wattmeter advantages
> over much cheaper stripline instruments...such as
> immunity to high electric field levels around the meter?

It makes it hard for technicians like me to wreck it! Don't know
about electric field shielding (but you probably will never need to
worry about electric fields at the transmitter end of the feed line).

> Are the many various range slugs...required due to
> the characteristics of the cast coaxial section?

No. As far as I know they are all used in 50 ohm systems. They are
for different frequency / power ranges.

> Cheaper wattmeters cover a much greater range!

>My applications include home use of course but primarily in the
>maintenance of a repeater system. Any of advice about metering
>practice would be appreciated when dealing with all the
>connections in and out of duplexers and amplifiers, etc.

As I remember, at one time there were requirements on the effective
radiated power of repeaters. If your repeater is well below the
limit, you don't need to know the exact power. As long as the feed
line is matched well, that should be all you need (unless something
breaks in the transmitter).

If you must adjust the duplexer, borrow a good RF millivoltmeter (Boonton 92 series), a good signal generator, and some 50 ohm attenuators. There is probably a cooperative ham with this equipment living nearby that can help you set it up.

I run a three transmitter NETROM node and borrow another hams reflectometer to check the SWR once in a great while. When I used to operate HF I used an old EF Johnson SWR Bridge (which is really just a reflectometer).

On good thing about Bird, their equipment is within advertised specs when new... many, many others are not. It is a good investment if you use it every day for business purposes, but most hams don't need one.

(Probably a TR2400?) ...

"UL" on the display means that something is causing the synthesizer to
UnLock ... in this case, since you comment on heat, may be heat-related.
If you do not have background and test equipment to service synthesized
VHF equipment (including good spectrum analyzer), I would suggest that it
is time for the radio to "visit the hospital".

Good luck, and very 73!

287. Value of Icom IC-21?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-06 00:00:00 UTC
From: jmlowman@ix.netcom.com
Message-ID: <4rkadh$jc1@dfw-ixnews6.ix.netcom.com>
Source record: 198265
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Can someone tell me what the approximate value of an Icom IC-21 2m FM transceiver might be?

I bought the rig in Japan in the early 1970s. It is crystal-controlled, has 24 pairs of crystal sockets, and has the more popular crystal pairs in use in the US at that time.

Downside is no CTCSS. I've been told that it might make a nice packet radio for someone.

Thanks in advance for any advice, and 73 de Jim - KF6CR

Well, I've had a chance to search my library for a good explanation of how Marcin's directional coupler circuit operates. I found a number of descriptions: some poor, some good, but the best explanation I've found is in the book "Single-Sideband Systems and Circuits," by Sabin and Schoenike (1987, McGraw-Hill), which I will try to summarize here.

"The Inductive Loop Directional Coupler"

First, I will attempt to crudely render their excellent drawings in ASCII format:

```
coax center cond.----------------------------------------

------------------------
| (pickup loop) |
/ |
\ R RF
/ Detector
\ |
| |
coax shield---------.------------------------.--------
```

(You may remark that this looks just like part of an inexpensive SWR meter that is readily purchased at most radio stores.)

Now, this physical circuit, for the purposes of analysis, can be modeled with lumped-elements as:

```
coax center cond.--------.-----------------------------------
|
----- C
----- M
| -------------mmmmm-----------
| |
/ |
\ R RF
/ Detector
\ |
| |
coax shield-----------.------------------------------.-----
```

Where, in this circuit:

C = The capacitance between the pickup loop
and the coax center conductor

M = The mutual inductance between the pickup loop
and the center conductor

(Note that for this lumped-element circuit model to hold true, the
dimensions of the coupling loop must be a fraction of a wavelength).

Now, to start the analysis I'm going to define some quantities:

E = the voltage between the coax center conductor
and the coax shield at the point of measurement.
I = the RF current in the transmission line
Vres = the voltage across the resistor R.
Vind = the voltage across the mutual inductance M
Vmeas = the voltage at the RF Detector
Xc = impedance of capacitor C
Xm = impedance of mutual inductance M

From the circuit and the quantities defined above, I know that:

Vres = (R * E)/Xc for R << Xc
(it's a simple voltage divider)

Vind = I * Xm (polarity of Vind depends on
direction of current flow)

Vmeas = Vres + Vind

= R * E / Xc + I * Xm (if current moving left to
right), or,
= R * E / Xc - I * Xm (if current moving right to
left)

Therefore, the voltage at the detector is the sum (or difference,
depending on the direction of the directional coupler with respect to the
load, and hence current flow) of a sample of the voltage across the
transmission line and a sample of the current through the transmission line at
the *point* of measurement.

I want to stress that word "point." The pickup-loop is very short,
just a fraction of a wavelength long. Thus we are making a measurement
of current and voltage at a "point" in a circuit, stuff of classical
"lumped-element" circuit analysis. Perhaps someone has attached a
transmission line connected to the coupler's output, or perhaps simply a
resistor with inch-long leads. I don't know, and the circuit doesn't
care - it's just sampling voltage and current at this one "point." And
somehow we must take this voltage sample and this current sample and
derive measurements of forward and reflected waves.

First though, it's important to note that, in this model, the
resistor is *not* an "absorbtion" resistor - that is, it is *not*
absorbing either an unwanted forward or reflected wave component in
order that the other (not absorbed) component can be measured (as at
least one book-published explanation would have us believe). Instead, it
is part of a voltage divider which samples the voltage across the

transmission line.

The model of an "absorbtion" resistor is, I believe, in this circuit topology the wrong model to use. When I first ran across it some years ago ("HF Antennas for All Locations," by Moxon) it confused the heck out of me, and it wasn't until I sat down and actually analyzed a directional coupler circuit that I found a model which would work in both "lumped-element" and transmission line applications. The "absorbtion" resistor explanation just does not make sense if you consider the loop to be a lumped-element.

I think part of the confusion is due the construction of the pickup loop itself, which is rather long and its function on first blush mysterious. Because of this length and the lone resistor at its end, I believe there is a natural tendency to accept the absorbtion resistor model. After all, it seems to explain that inexplicably long loop! But remember, at the frequencies where one commonly uses these couplers, the pickup loop length is a *very* small fraction of the wavelength; it's so short that it can be modeled as lumped-element(s), which in this case is an inductor (and capacitor). We could just as easily replace this pickup loop with a toroidal coil and a real capacitor, and we would obtain the same results.

But I digress. Back to the analysis!

Let's imagine that our application calls for a transmission line to be connected to the output port. Is there a way that we can chose the values of R, C, and M such that the voltage at the RF detector is related to either the transmission line's forward voltage or it's reflected voltage, depending on the directional coupler's orientation?

Yes there is! But first, let's write a couple of more equations, this time from transmission line theory:

E = Ef + Er, where:
E = the voltage between the coax center conductor
and the coax shield at the point of measurement.
Ef = forward voltage component of E.
Er = reverse voltage component of E.

I = If - Ir (subtract because the reflected current travels
in the opposite direction).
I = the RF current in the transmission line.
If = the foward current component of I.
Ir = the reverse current component of I.

And, because If = Ef / Zo and Ir = Er / Zo by definition (Zo is the characteristic impedance of the transmission line at the point of measurement), by simple substitution we get:

I = Ef / Zo - Er / Zo

Now let's substitute these three equations into the two earlier equations and re-derive the value of Vmeas.

1. Vmeas = (R / Xc) * (Ef + Er) + (Xm / Zo) * (Ef - Er)
(forward direction)

2. Vmeas = (R / Xc) * (Ef + Er) - (Xm / Zo) * (Ef - Er)
(reverse direction)

To make these two equations relate to either the forward voltage or the reverse voltage independent of the other, we are going to define the values of R, C, and M such that the following relationship is true:

R / Xc = Xm / Zo (in other words, R * C = M / Zo)

Let's plug this into the above equations. These equations now reduce to:

1. Vmeas = 2 * R / Xc * Ef (forward direction)

2. Vmeas = 2 * R / Xc * Er (reverse direction)

We now have seperate measurements for both the forward and reverse direction components of a signal on a transmission line! (Note too that the value of these voltages will change with frequency due to Xc).

That's it. Hopefully, I neither made too many mistakes in my derivations above nor confused the reader too much. Directional couplers are an interesting topic, and if you understand the theory behind the one I've just described, analyzing other directional coupler topologies will be amazingly straightforward (hint: usually they replace the pickup loop with a real toroidal coil and capacitor, or a similar voltage and current sampling topology).

Cheers,

- Jeff, WA6AHL

Steve:

With the programming kit (software & interface cable), and a known-to-be-good profile file, you would be able to restore it with no problem!

I have all the above. If you want to pay shipping both ways, I'd be glad to dump my U.S. profile into your radio at no charge.

> 73's
> Chris Vallliant

You need to put your antenna higher or go to a vertical that works
against the ground if you can't raise it to at least 1/2 wavelength
high.

First, 8 feet off the ground is barely 1/4 wavelength off the ground
at 10 meters. This is doing three bad things:
1. It throws off (reduces) the impedance of the antenna
feedpoint, because the ground is partially conductive
and in the antenna's near-field. This is bad, because
a dipole is balanced and doesn't need a ground to work
against. And obviously, this raises the SWR.

2. The ground actually will absorb power from your transmitter.
It's the "heat the earthworm" factor.

3. It messes up your radiation pattern. It will look more like an
isotropic antenna and put a lot of energy at high angles.
At 10 meters, this you do not want.

That being said, I doubt your SWR is actually 6:1.
I read in the Radio Amateurs Handbook that you
need a balun at the antenna feedpoint, or otherwise

strong currents will flow on the outer conductor, pretty
much equal to the current flowing in the inner conductor.
For some reason I don't understand, this "confuses"
SWR meters and other equipment since the shield
is not supposed to carry current.

So, try the balun, and raise the antenna another 8 feet, and
I bet you'll get a much better SWR.
Just my $0.02 worth.

Ross

300. ICOM IC-2350H - Need HELP !!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-06 00:00:00 UTC
From: Bill Stewart <stewart@peganet.com>
Message-ID: <31DE7CE7.5ACC@peganet.com>
Source record: 198278
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

I have an ICOM IC-2350H dual band rig with what I believe is a
programming bug.

When I transmit on either band it does not mute the receiver on the
other band. So when I am key down if someone talks, or was in the
middle oftalking, on the subband they come through my speaker and are
picked up by my microphone as background, and retransmitted. It's quite
annoying to hear someone talking about a totally unrelated subject while
I am trying to rag chew.

To head off the inevitable questions, no this is not a harmonic, and
yes, I have the subband mute functions on in both bands. This is simply
a case of the transmitter failing to mute the receiver of the subband.

ICOM offers no direct support, and has not responded to the compuserve
address someone was good enough to send me. My dealer, THE HAM STATION,
says there's no fix for the problem.

I refuse to accept that I have to manually turn down the volume on the
subband when I wish to transmit, and then remember to manually turn the
volume back up. This is not only stupid, it's darn poor engineering.

Anybody got a suggestion for a fix or mod ?

Thanks much,

>Thanks much,
I have the same radio, it is about a month old. My manual states that the
sub-band mute feature "Automatically mutes sub bands audio signals when the
main and sub bands signals are simultaneosly received" The key word is
received, it doesn't mention anything about muting the sub band when
transmitting. Maybe you have an earlier version of the manual and since then
they have corrected the typo.
Here is something that may make you feel better. My manual made no
reference to the cross band repeat feature that Icom mentions in their ads.
But it is there. While the radio is on and set to your desired frequencys(they
may have to be programmed into memory and not in VFO mode), push both MAIN

buttons and the SET button simultaneously, hold for two seconds you will see a flashing "L" underneath each band indicating you are operating cross band. Now you have your own repeater! To turn it off, hold just the SET button for 2 seconds. NOTE: Turning the radio off does not turn this feature off.
There is supposed to be a remote code for this feature as well, but again, the manual makes no reference to it. If you learn of these, please e-mail me.

Hello,
A friend told me that if the internal battery is disconnected
from the radio that the microprocessor would need to be reset.
I coulod find nothing of this in the radio, but think that the factory
thinks that everyone will send it in to get the battery replaced and
they will service it there and reset the chip. Any ideas on how it is
done if it is necessary? Thanks a lot.

Source record: 198297

I am W6KLK. I am using my Yaesu FT-890 in my 1992 Toyota PU V-6 for mobile operation. The noise from the electronic engine control (located on the passenger side panel) is severe and making reception impossible. I am an electrical engineer and I have done mobile noise supression in the past (1950ties) but I am stumped on this one. It appears to be radiated interference, not conducted, but I may be mistaken.

I would appreciate suggestions on how to solve the problem.

Please respond by email. Thanks!

Keith W6KLK <knelson@aimnet.com>

320. Yaesu FT-50/51 Question

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-06 00:00:00 UTC
From: Steve Wolf <no8m@apk.net>
Message-ID: <31DF1287.5E6A@apk.net>
Source record: 198298

Hi ...

I am considering the purchase of either the 50 or 51 Yaesu handheld
to replace my FT-470. My normal operating operating practice is to place
public service frequencies on one band and talk on the other ... AT THE
SAME TIME. Although the 50R has its "dual watch" function, I suspect it
is not the handheld for me. I couldn't just poke the PTT knowing I was
on a two meter simplex but still hearing a UHF conversation.

What handhelds are able to scan and receive, let's say four
UHF frequencies AT THE SAME TIME as talking on two meters. I need to,
while transmitting, hear the UHF side of the conversation.

It appears that the 50R will not allow me to monitor a 460
frequency while transmitting on two meters. Will the 51R? I would like
to stay with Yaesu as they have the programming software.

To further explain my operation, let me give some examples.
We go to various amusement parks. At Cedar Point, in Sandusky, Ohio,
we scan about five 460 frequencies ... security, park maintenance, ride
maintenance, parking, etc. We are able to discern park inflow and
outflow from parking, ride availability from maintenance, etc. However,
my friends and I talk (via the Yaesu earphone/tiny lapel mic) on 146.58.

Please, does Kenwood, Icom or Yaesu make a unit that will copy
both bands?

Does this radio then have available a computer program whereby
I can have a file for King's Island, Cedar Point, King's Dominion,
Geauga Lake, Kennywood, etc. (hi hi). I suspect the FT-51R is what
I'm looking for.

I too have had intermod problems with the rig in downtown area, probably
from pagers. The ads for the rig say it has special rejection built in
for this problem. Ho Ho Ho. Am thinking of buying a filter I saw
advertised in FLORIDA SKIP for a VHFDN152 from PAR ELECTRONICS. It's
specific to pager frequencies (or can be tuned at the factory) and sells
for $62.00. The problem only gets me going to and coming from work and
only in a specific area, so I am kinda waiting to see just how bugged I
get about that.

I've also gotten word that the rig DOES HAVE the cross band repeater
function built in, it's just not documented. Hold down both main
buttons and the set button until a flashing "l" appears. Hold set
button for 2 seconds to disable. Haven't tried it yet but if true, it
certainly fits with this problem.

Bill

: get the unit to key up my radio (An HTX-202) when the patch is put
: into use. I can manually press the PTT button and HEAR the phone
: audio going through, but it does not activate the transmit circuit on

Connect the PTT output of the patch to the tip of the mic input
thru a 2.2K resistor, and the mic output of the patch also to the tip
of the mic input of the HTX-202 thru a .22 uF cap. I liked using a
bit larger cap (1 uF) for use with this patch.

One comment about the patch - the instruction manual says the DIN
connector pinouts are the same as a TNC cable, but they're not. I
ended up wiring a second pigtail on an existing TNC cable to connect
the patch to my radio.

Now *I* have a question (for anyone who's reading): is there a way
to substitute an EPROM or EEPROM part for the 87C751 (2K OTP ROM)?
The commands for this autopatch are hard-wired into that ROM. I'd like
to find another user-programmable 8051-family part to replace it.

329. ICOM 2350 H UHF Expanded Receive

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-07 00:00:00 UTC
From: <>
Message-ID: <4rnapg$bue@wrqnews.wrq.com>
Source record: 198307

I looked up the only posted mod at QRZ for the Icom 2350H which tells how to open up the transmit (Cut W1 on the control panle pcb) and expand vhf receive (Remove D9) and expand uhf receive(Remove D10).

What the mod doesn't give is a component layout for the pcb. Also, I am curious about the frequency range removing D10 will buy me.

Before I pony up the $35.00 for a service manual, has anyone else cracked the code on this rig yet?

BTW, I am pretty happy with this unit, although I have experienced the two main gripes others writing in here about have:

1) Intermod with pagers (Happens on the way to work in two spots downtown) It's pretty bad, but temporary and short.

2) Ocassional cross talk from the other band while transmitting. I find it distracting but it's simple enough to just trun down the volume on the rig. I use the sub-band beep function, and it serves as a good reminder to turn the volume back up if I forget.

On a scale of 1 to 10, I'd give this rig a 7. That opinion may change once I've owned it longer.

Thanks for any input you may have.

330. ic-2700 mod collection.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-07 00:00:00 UTC
From: an622231@anon.penet.fi
Message-ID: <055302Z07071996@anon.penet.fi>
Source record: 198308

Here are some mods i have collected for the Icom ic-2700h.

Following mod is valid for the EUR version.

****
Expanding rx frequency range:
****

By keyboard only:

Press SET end DTMF keys simultaneously while
turning ON the power switch. Hold the keys a few
seconds.

By means of diode EUR version:

Remove the D13 diode on the logic unit.

For ITA version:

Remove D8 will open AIR band only.
Remove D9 will open 430 and 800 MHz bands
Cut W1 jumper open all bands.

RX frequency range is now:

118.000 - 135.995 MHz (AM) (VHF section only)
136.000 - 174.000 MHz
320.000 - 479.000 MHz
830.000 - 999.990 MHz (UHF section only)

****
Expanding the TX frequency range
****

- 144 MHz band only: Remove diode D17 on the logic unit.
- 432 MHz band only: Remove diode D16 on the logic unit.
- All bands: Remove chip-jumper W2 on logic unit.

****
Restricting frequency range
****

When diode D7 is present the RX and TX frequency is
limited to 144 - 146 MHz and 432 - 438 MHz provided none
of the above mods have been made.

****
Cross Band Repeater

****

Removing D14 will allow use of cross band repeater and
DTMF remote control functions.

Activate "hang up time" type repeater:

Push the VHF and UHF main knobs and the SET/LOCK
key for more than one second.

Activate "no hang up time" type repeater:

Push the VHF and UHF main knobs and the SET/LOCK
and DUP keys simultaneously for more than one
second.

To return to normal mode, press SET for more than one
second.

****

==========
This mod from: ftp.cdrom.com - has been slightly modified.
==========

Hi there! From Icom USA comes this mod sheet for the 2700H:

RX Expansion Modification
==========
1. Remove Top Cover. (6 Screws)
2. Remove Bottom Cover. (6 Screws)
3. Remove Front Display. (4 Screws)
4. Locate the Logic Board.
5. Remove W1 from the logic.
6. Hold [SET], [SPCH] and turn radio on.

Expanded Frequency Range

AM Mode 118-136 MHz
FM Mode 138-174 MHz
350-470 MHz

Tx Expansion Modification
==========
1. Remove D16 and D17
2. Hold [FUNC], [A], [CLR] and turn the radio on.

FM Mode 138-174 MHz
350-470 MHz

Bill,
You didn't mention why Icom offers no support. I have always found
their support to be excellent. Just call Icom America and ask for tech
support (they are in Washington state).
If they can't or won't help you, seems like a RS miniature relay in
the audio line / PTT circuit would be a quick and easy way to
disconnect receive audio while you are transmitting.

Hello

Is there anyone out there who could give me any information on a Phillips VHF tranceiver. The tranciever is a synthesised set , made in Australia. The plate on the case says :

Phillips - TMC
Made in Austrailia
FM 92 BL25X34567

The radio was produced in 1984 and the original software was compiled in 1982. At the moment it is tuned to around 150 MHz. I would like to know where i could get information on changing the frequencies and a workshop manual with schematic diagrams.

Please email me at : seanmcd@iafrica.com or seanmcd@iaccess.za

thanks
Marc

You remove the metal battery contact plate (4 screws) and you cut the
red and blue wires.

Well I finally found the non-functioning diode in the passband filter.
I believe it was D2020, I fortunately had a small diode in the shack and
the FT-900 is back in fine order.

73 =paul= wb8zjl

p.s. Do not start your engine while the FT-900 is ON if you are running
mobile :-)

I am looking to by this radio for my wife who is blind. She likes the idea of not having to carry two radios (one scanner and an HT). Before we make the plunge though, I need to find out how well she will be able to use the radio.

- How do you change bands (vhf/uhf).
- How do you set the volume.
- How to start scan mode.
- Does it have automatic repeater shift.

I own an ft51r and assume that frequency entry and storage into memory are the same.

I am sure I can think of many other questions but don't want to take up too much bandwidth. Any help would be appreciated.

Thanks, John Potts

Curt:

I don't think the software will do it for you...I know it won't on the FT-50R. It's probably a hardware mod like most of them are. Have you called YAESU?

Hi, Nick...

I checked my 733, and it is receiving OK withing that range. Specifically,
I just monitored some traffic on 130.525 on both my 733 and an AOR AR-3000,
and they heard the same signals well.

This is in a model sold in the US.

I made the basic MARS/CAP mod as detailed by Bill Childers but lost the capability to download from the ADMS-1C software Ver 1.04 is this a bug in my radio or in the software? Also has anyone heard of a way to enable transmission/reception on the 222-225 Amateur band. I have heard that the reason this capability is not here is because of Public Safety frequencies in Japan are in this range.

I got this straight from Icom. Remove the bottom cover. Remove the speaker. It
is clipped onto the side of the case so you will have to give it a pull. On
the front panel there is a small access port, if you want to call it that
right where you removed the speaker. You will see a white diode plain as day
sticking in th board. It is the only one there. Cut it and you are done.

RX 2 M
118-174 mhz
RX 440
320-479 mhz
849-870 skips cell let me know if you find a fix for this please.
894-950
It is a very easy mod, let me know how it goes.
Also if you could let me know if you find out anything about the remote codes for turning on and off the cross band repeat feature I would be very greatful. Just in case you don't know how to do this via the radio(the manual doesn't mention it) when the radio is on push both bands MAIN button and the SET button simultaneously, hold for 2 secs. and you will see flashing "L"'s below each band. Hold set for 2 secs. to turn it off.

Have fun!

353. Tahoe/Suburban Ant Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-07 00:00:00 UTC
From: Gary Duffield <duffield@indirect.com>
Message-ID: <31E01002.6EE1@indirect.com>
Source record: 198331

I just purchased a Chevy Tahoe and can not find a mounting location for a dual band mobile antennia. I am trying to avoid glass mount.

Any ideas? please.

Thanks

Gary N7NQM

354. Mirage BD-35 info request

Try popping the plastic cover off the overhead interior light. See if that
gives you access to the metal of the roof. (It does in older model
suburbans and blazers - - don't know about the past couple of years.)
I have drilled through the roof via the inside of the light compartment, and
run the coax across the roof line between the headliner and the roof, and then
down the paneling by the doors. This will involve taking some screws out of
some molding strips beside the doors. I would make sure that the cable can
be run in this manner _before_ I drilled any holes in the roof.

Icom IC-775 for sale with DSP unit and crystal oven installed, plus all 2nd and 3rd IF filters installed. That's five filters, no slots left open on mother board. Rig new in January '96, hardly used. Six mods made at Icom prior to shipping at purchase. Selling rig to start new business. $3100. de Ed, AA0HI, edvanc29@skypoint.com.

If you are going to remote the head, MAKE SURE you get the cable. I got my 706 in late April, and am still waiting to get the cable for remote mounting the head. So I still have it sitting on my desk top, and can't put the IC-706 anywhere secure in my vehicle without the cable.

The head remote mount cables have been on back order FOREVER.

But after 2 months use, I like the rig... hate the company's response...

>explanations:
>
>ff, WA6AHL

-hello
you are not as it were at the sea shore but at a point some distance off
toward the land the sea is giving up it's energy to a rock , the rock can't
absorb all the energy as it's consistency is miss matched so it reflects
energy back into the sea and there is a back flow of current which causes
a flow against the tide, waves are produced (and make life uncumfortable for
small boats parked at such an observation point)
your observation will note the massive inflow and the reflected wave at
anti-nodal points, there will be a big positive wave with a small negative
wave supperimposed by attenuating the positive displacement produced the
reflected wave can be measured as a ratio of the larger (hopefully if it is a
near match situation)

It is one of the questions in the pool, but it isn't necessarily on
every test. However, it is naive to use that formula for a real antenna.
You almost always have to adjust the length in order to account for other
variables. The formula gives a *free space* value, but our antennas are
rarely mounted in free space. There are also mechanical factors to consider.

It is not unreasonable for a new amateur to ask this sort of question.
Often those things which appear simplest to those of us with practical
experience can be the most baffling to those with none. Remember, the
only stupid question is the one you neglected to ask.

>Dave KE6AJC

Hi Dave,
My Zetel autopatch fried its 87c751 cpu a year ago and after fruitless attemps to contact the company and
Ramsey to sell me a replacement part, I decided to replace the cpu with a 68705 (I"ve got tons of them and am not too bad at programming them). The only problem was that I had to write the program from scratch. (NOT an easy task). I'm still working at it and can get it to accept commands to get a patch going. The only thing that still needs adjustment is the VOX algorithim. (Tricky to program). All other settings for now are hard coded in the eeprom. The problem with using a 68705 is that it is a 28 pin large IC and I had to make a small circuit board to adapt the socket size. I couldn't get the source code from Zetel either. So if you intend on replacing the cpu, you've got a lot of programming to do.

Yaesu makes an adapter for the FT50 that plugs into the radio and allows one to use any "standard" Yaesu dual plug mike. The adapter clips to the antenna for support. Works fine.

>Brian Olliver

Brian,

Thanks for the analogy, I like it better than mine - a beach is a lousy
place to view wave reflections. A rocky cove is much better.

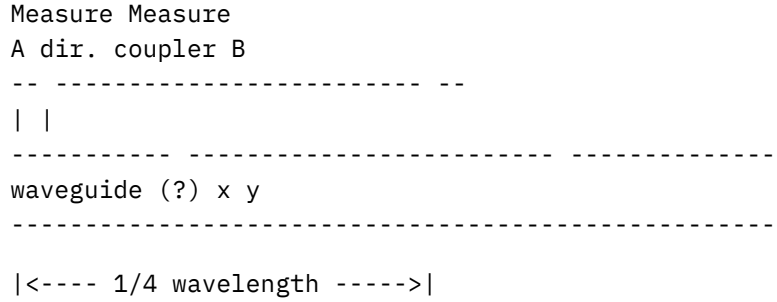
My argument is, if you look at just one point in the water, you won't
see two different waves passing in two directions (the forward and
reflected waves). Instead, you'd see the water moving up and down as
the waves passed, with the height of this movement determined by the
constructive/destructive interference of the two waves passing each
other. But you could not seperate out the two waves as being two
distinct, seperate entities - all you see is the resulting sum of their
interaction.

I chose to observe a "point" in the water to illustrate the operation
of a lumped-element directional coupler. It "observes" the current and
voltage at one point of a transmission line. These two quantities are
then used to calculate forward and reverse voltages (a good explanation
of how this works appears in an old article by Bruene in the April, '59

issue of QST).

Of course, there's no reason to measure at just one point. Way way back during my University days I was taught that you find SWR by measuring the voltage along a transmission line: find the max, move 1/4 wavelength and find the min, and calculate SWR. I remember being puzzled because I knew that my SWR meter in my shack was not 1/4 wavelength long, and wondering how the heck it did this! It wasn't until recently that I finally understood it (at least, I think I do).

And to digress slightly, I once ran across an example of a directional coupler that truly did find forward and reflected parameters by using constructive/destructive wave interference. If I recall correctly, it was 1/4 wavelength long and looked something like this:



(I think this was done with a waveguide, but I can't remember.)

It worked as follows:

A wave traveling from left to right enters the coupler's port x and travels towards port y. Meanwhile, it is still traveling down the waveguide towards port y. When the waveguide's wave reaches y, it enters this port and, because both it and the wave within the directional coupler are in phase, they add and appear at port B.

However, the wave that entered port y also travels back down the directional coupler towards x. When it reaches x, it has traveled 1/2 wavelength (1/4 from x to y, and 1/4 back again), and so is 180 degrees out of phase with the wave coming in through port x. These two waves cancel, and nothing appears at A.

For a wave traveling in the opposite direction, the reverse happens, and it appears at port A, but not B.

Pretty cool, but frequency dependent.

(Anyone, please correct me if I'm wrong).

379. IC-970 freq. adjustment ??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-08 00:00:00 UTC
From: ea4abb@ea4rct.CLubs.etsit.upm.ES
Message-ID: <49552@ea4rct.clubs.etsit.upm.es>
Source record: 198222

Hello everybody !

I want to buy to a friend an ICOM 970, the problem is that the principal VFO is not well adjusted and it receives 1 Khz down.

Do you know what need I to touch in the radio to adjust is ?
I have good equipments to adjust it like spectrum analyzer, freq counter... but I only need to know what I need to mod...

I have just acquired a couple of Standard Radio UHF handhelds
Model HX240U(AB) at a local hamfest. They display the letters CL
when turned-on. These are commercial HT's. No keypad, just 4 buttons
across the top of the front plus light and monitor buttons.

Any help with information (programming/manuals/etc) on these units
would be greatly appreciated.

Thanks,
Larry Rothman VE3LRI

Rohn prints a complete tower handbook that Gerald keeps in stock for sale at Texas Towers. The cost a year or so ago was about $7.50 or so. It is a gold mine of information on just the essentials you need for designing bases and so on for Rohn products, which, can be reasonably extrapolated to other towers.

The cost is trivial, compared to either an accident or, worse, getting hurt.

Texas Towers is listed in any QST or CQ. I'm sure you can also find the book at Missouri Radio, or any other one of these places that stocks Rohn. The local shop in Beaumont that handles Rohn can also get one for you. Even if they charge you the list price of $7.50 or whatever, its worth it.

391. Re: bincancel:20 large binaries:AR478:@@NCM

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-08 00:00:00 UTC
From: red@redpoll.mrfs.oh.us
Message-ID: <ARMM-Report-478.a@redpoll.mrfs.oh.us>
Source record: 198234
Cross-posted to: alt.retromod,comp.os.linux.setup,rec.arts.prose,rec.bicycles.marketplace,rec.music.makers.percussion,rec.radio.amateur.equipment

Large binary posts do not belong in unmoderated discussion groups.

I run a program that searchs for, and issues advisory cancels for,
large binaries in the akr, biz, comp, misc, news, rec, and sci
hierarchies.

I have issued 20 cancels for large binary files (average size 103,463
characters - total size 2,069,251 characters) posted to 5 different
unmoderated discussion groups in the comp and rec hierarchies as
follows:
13 rec.arts.prose
4 rec.bicycles.marketplace
1 rec.radio.amateur.equipment
1 rec.music.makers.percussion
1 comp.os.linux.setup

This pointer is being posted to each affected group listed above.
Follow-ups are directed to news.admin.net-abuse.misc.

If you want to see exactly which file was deleted from a particular
group, read the full report in news.admin.net-abuse.announce. The
full report can also be found in alt.nocem.misc and alt.retromod.
Look for AR478 in the subject, or, if your reader supports it, use
this URL: news:ARMM-Report-478@redpoll.mrfs.oh.us

The criteria used to search for this batch of large binaries were:
NEWSGROUPS: Unmoderated akr, biz, comp, misc, news, rec, or sci
(except for comp.binaries.apple2, comp.bugs.2bsd,
and rec.games.bolo)
BINARY: base64, binhex, uuencode, and xbtoa encoded files, etc.
SIZE: > 100,000 characters [(size * (# of parts - .5)), if multi-part]

If you must post a binary to Usenet, please post it *only* to an
appropriate binaries newsgroup such as alt.binaries.misc, and do *not*
crosspost it to non-binaries groups. Then, if you like, post something
in the appropriate discussion group telling people where to find the
binary in the binaries group (a pointer to the binary). This will
permit news administrators and users to decide for themselves whether
to receive the binary files.

Please direct public feedback to news.admin.net-abuse.misc and private
feedback to red@redpoll.mrfs.oh.us. Thanks.

Best wishes,
Dick

The ICOM unit to purchase is the AH-3 (160-10 meters), not the AT-500? which covers up through 6-m but only matches a rather limited range of impedances. Another, slightly cheaper, unit is from SGS. I bought one of theirs but haven't tried it yet. Both the AH-3 and the SGS are three times the volume of the 706!

Thanks for the beta. I've been in there looking around and the diode you refer to appears to be W1, which other information I had listed that as being the one to cut to open up Transmit on all bands.

Seems like if your info is straight from Icom, it's worth it for me to go down to the car and get the rig, cut the jumper and try it out. I'll let you know...

I've tried the cross band repeat, and it works nice. Once I figure out some practical applications for it, I'll use it from time to time. If I discover the DTMF remote codes for activating it, I'll pass them on.

Overall it's a good rig but it has some flaws.

The noise blanker works poorly if at all.

The CW QSK is poorly designed, and the keyer has no weight control.

The rig suffers filter leakage if the narrow CW filter is used

But all and all, it's a pretty good value and the extra bands and convenience makes it worth it The CW flaws are my only real gripe.

From: odedr@lune.math.tau.ac.il
Message-ID: <4rrtec$rur@post.tau.ac.il>
Source record: 198243

Hello !

I have a problem with my TS-790 that keeps appearing
from time to time. It is not fatal yet but it's very annoying.
The problem is that the VHF tranmitter sometimes locks and I have
to release the P.T.T. in order for it to transmit again. It was fixed
several times before and now it seems much less severe. However, if anyone
has new information about its cause and a way to permanently fix it
I would be very happy to hear about it.

Thanks, Oded

I have the AT180 (the small unit covering 6M) and to this day still have an unresolved problem (including a trip to ICOM which didn't fix it) where the unit puts itself offline in SSB sometimes. ICOM has acknowledged the problem but (since mid May) still has no fix. I'd discuss with ICOM their position on this problem before buying one.

That's because it can be done. It is possible to run a simplex on two meters. The term "unattended" is where there might confusion. No station carrying third party traffic can operate automatically including a repeater (there are exceptions for things like packet messages). But a control operator can be at any "control point". A control point can be a auxilary station, wireline, or local control point. There is nothing that says wireline control has to be on a switched phone line.

It is not illegal, on it's face, to utilize a 2M simplex patch. It is no more illegal than a duplex patch on a 2M repeater.

I need to align a KDK 4033 mobile transceiver (440 band). Would
appreciate help locating a schematic or manual. Will settle for
a 2033 (2 meter version) as they are similar. Any help appreciated.

Ahb,

From Yaesu, and not even from them yet. I've tried numerous electronics sources, but as yet no one
has that "ring, ring, ring, tip" plug. If you run one down, post the info! The entire world awaits the data!
Seriously, I ended up buying the Yaesu brand adapter for packet use and the Yaesu speaker mic.

411. FS: HP 1740A 100Mhz Oscilloscope

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-08 00:00:00 UTC
From: Dan Ellefson <sl3jj@cc.usu.edu>
Message-ID: <31E195B9.772B@cc.usu.edu>
Source record: 198254

FOR SALE: HEWLETT PACKARD 1740A ANALOG 100Mhz OSCILLOSCOPE

The unit is a two channel 100 Mhz oscilloscope with two external triggers.
It comes with two HP X10 probes that came with the scope and two B&K X10/X1 probes
that I bought brand new. All the probes are rated at 100 Mhz. The scope is capable
of deflection factors from 1 mV/div to 20 V/div on the vertical scale and 5 ns/div to
20 s/div on the horizontal scale. The scope also has a delayed sweep feature which is
set by a precision control knob which allows delay settings of 50 ns to 20 s. Other
features of the 1740A include simultanous display of both input channels and the trigger,
bandwidth limit control for attenuation of signals above 20 Mhz, plotting channel A vs B,
choice of 50 Ohm or 1 Megohm input impedance, Chop mode, Alt mode, A+B display, channel
B inversion (this allows A-B display), trigger selction of channel A, B, or external,
trigger level control,LF and HF reject on external trigger inputs, AC, DC, Internal and
External triggering, External /10 triggering, and many more features.
Documentation for the scope is included and consists of the 1740A Operator's Guide
and the 1740A Operating and Service Manual with includes detailed schematics of the scope's
internal circuitry.
The scope comes with a soft leather pouch with a velcro closure that is attached
to the top of the unit allowing storage of manuals and probes. A hard plastic cover is
also included that fits snugly over the front face of the scope to protect the controls
and CRT.
The scope is in very good condition with no noticable dents or scratches. I've had
the scope for quite some time and have been very pleased with its performance and the great
many features that come with it. The reason that I am parting with it is because I recently
purchased a brand new $4500 scope (ouch....) and have no need for two scopes.

PRICE: $450 (buyer pays for shipping)

> and if so, how do you like it?

I have the TR-7950, the 45 watt version of this radio. I purchased mine new in '85. It still has the original back-up battery for the memories! (Any day now, I suspect... <snicker>) The TR-7930/50 was discontinued fairly soon after I got mine... I forget the the model number that replaced it, but it was fairly similar operational wise.

> One problem I have with this radio is the TU-79 tone board

> the tones?

Have you thought about taking one of the three slots, say F3, and cutting all the diodes and then installing a set of six switches or DIP switches to program your PL? I was going to do this, but never completed the mod. Put your most used PLs in F1 and F2, use F3 for your variable.

> Finally, are there any modifications to extend the receive
> on this rig? I guess I'm spoiled by the extended receive on most
> newer 2m radios!

Nah... Be happy you've got 142-148.995 MHz. I've not seen any mod that would extend the coverage of this radio. That's OK, too. I have almost NEVER been bothered by intermod with this one.

Have to be a 'mod'. The radio is working as it was designed to work. I
don't have a service manual, so I can't tell you how hard it would be to
mod, but it's probably do-able.

Source record: 198258

I may be mistaken but a few weeks back I believe someone posted a query regarding the comparison between the Yaesu FT 1000D and the FT 1000 MP. I was wondering what the results/responses were, especially regarding 1). which had absolutely the best receiver, and 2). which was the best value. If the person who posted the original question would be kind enough to summarize the responses, I would be most grateful. If such a question has not yet indeed been posted, then let me put it on the table now. I would be most interested in the comparison. Many thanks and best 73s to all. de John, KI7JB, Seattle, WA.

416. Re: Yaesu FT-50/51 Question

> It appears that the 50R will not allow me to monitor a 460
frequency while transmitting on two meters. Will the 51R? I would like
to stay with Yaesu as they have the programming software.
<

I have the 51r. I knwo exactly what you are talking about. My first impression of the 50 was of disappointment for exactly the reson you mention. The 51r does exactly what you want. In fact, it is flexible as you can set it either of three ways. One is to mute it completly. 2nd is to not mute it at all. 3rd, is to only partially mute it. Whoops. I just made a mistake. The above applies to transmitting. There is a seperate function that allows you to have the sub band audio either muted, on full, or reduced while you are transmitting. However, you can either select that when both stations are receiving, one or the other can be set to automatically mute. The easy thing about this, is the seting is to simply set the sub-band. Which ever is ntohe main band, is muted. Of course, the other option is to NOT have it automatically muted (as you woudl like it to be), but you are still able to turn the volume on either one or the other. In your case, since you will want the sub band not muted, then you woudl need to use the feature that iether mutes or reduces the sub band while you are transmitting.

As far as the rest of the radio goes, I am VERY pleased with the two that I got for my wife and I. I recently purchased a mobile Yeasu 5100, and I have toi say I wish I had just gotten another 51r, they are that neat. Currently, I ahve a Radio SHack 212 while my 5100 is in for repairs (it was sold to me deffective by a low life here on the net!). Feel free to ask me other questions. I regularly use software, on a Macintosh even. They said it couldn't be done, but I have it working under SotfWindows, and it works beautifully. In fact, I am just about to plug in frequencies for a vacation to Colorado. I usually only have two programs, HOME here in Beaumont, and one for when we go to Houston. It is VERY fast. The only frustrating thing is to remember that if you make a change in one program, you have to make it in another, if you need to. Cloning between two units is even easier!! SInce I have different call signs in the memories, I usually don't use this feature anymore, and just use the software to program each radio.

IN summary, I an assure you that you will definately find the 51r a very nice radio. I do not know what all has come out inthe past year, but when I did my research last August, I found the 51r to be the best choice overall. THere was one other radio, it might have been the Kenwood, that I thought was very comparable, excpet for the software, and one very big difference. THe keypad on the 51r is back lit, the Kenwood is not. THis is a tremendous difference!!! Even if I am not in

the dark, there are times when the back lit keys are necessary. If you have several buddies that all have DTMF radios with DTMF memories, you will be able to make some neat calling groups. THe message paging is effective, especially if you leave your rqadio montioring somewhere whiel you do something else. WHen you come back, you will know if anybody, or if somebody specific tried to call you. There are DTMF memories that really make using a Phone patch VERY easy to use!! No fumbling around for the buttons, etc. The number of memories that this thing will hold is outstanding, especially if you can go with out the alpha spelling of the frequencies. If you and your friends do mostly simplex, it is easy to make sure that you are not interupted by unwanted chater usign the encode/decode, or DTMF code calling. There are all kinds of ways to do it. As far as CTSCC, one neat thing is that you can usually fast the tones through a repeater, as long as the repeater doe snto require a tone already. Whay my wife and I do is monitor one channel (of a repeater) which has the tone and tone squelch turned on. If one of us wants to transmit, we drop down a channel to make sure the frequency is not un use (althought the green busy led would have lit up on the other frequency even though it woudl not pass sound), and the transmit. This second channel is a mirror of the other one, excpet of tone and tone squelch, it only sends a tone. In other words, it will pass all audio, and when I transmit, it will apss through to my wifes radio.

Anyway, hope all this info helps.
Drew

Bob Don't know how old your 761 is but it sounds like the classic phase lock
loop drift.If you have the service manual it is a relatively easy
re-adjustment.You only need a good volt-ohm meter.If you don't have the
service I am sure a call to ICOM will probably get them to copy those pages
for you .ICOM has replacement ceramic capacitors for those in that PLL but
that requires a bit more effort. Good luck-that 761 is a fine piece of
equipment. 73 Lloyd(W3NF)

Software for the FT-8000 wont be out till September.

The front end receiver in the 8000 is the same as the 8500 w/ Yaesu's
"Track Tunning". Receive should be very sensative and rejection good.
In my use of my 8500 for 18 months now mobile, I have yet to get ANY
intermod hear in the LA basin. Out of 8 radios used for VHF/UHF this
is a first in 9 years.

> If unattended, the required control link must be wireline or on
222 MHz or higher. Therefore, unattended "simplex" patches on
2-m do not comply with the rules.
<

I do not understand wireline? Does this mean that if the patch is controlable form a telephone, then I do NOT have to have a radio control link at 222 or up?

Also, as this was brought to my attention earlier, I have read the text of Part 97 and have failed to find where it says specifically that it can't be done. I did find where it would seem that it would rule out ANY sort of a patch because there is no control operator at the transpoint point, if strictly interpreted.

S 97.7 Control operator required.
When transmitting, each amateur station must have a control operator.

But then there is the following section which says that it can be remotely controlled:

S 97.109 Station control.
(a) Each amateur station must have at least one control point.
(b) When a station is being locally controlled, the control operator must be at the control point. Any station may be locally controlled.
(c) When a station is being remotely controlled, the control operator must be at the control point. Any station may be remotely controlled.
(d) When a station is being automatically controlled, the control operator need not be at the control point. Only stations transmitting RTTY or data emissions on the 6 m or shorter wavelength bands, and stations specifically designated elsewhere in this Part may be automatically controlled. Automatic control must cease upon notification by an EIC that the station is transmitting improperly or causing harmful interference to other stations. Automatic control must not be resumed without prior approval of the EIC.
(e) No station may be automatically controlled while transmitting third-party communications, except a station participating as a forwarding station in a message forwarding system.

Now here is one part where it says something about the freq restriction:

S 97.201 Auxiliary station.
(b) An auxiliary station may transmit only on the 1.25 m and shorter wavelength frequency bands, except the 219-220 MHz, 222.00-222.150 MHz, 431-433 MHz and 435-438 MHz segments.

(d) An auxiliary station may be automatically controlled.

But is a simplex patch a auxiliary station? Why isn't it a repeater?

Under repeater stuff, it says:

S 97.205 Repeater station.
(d) A repeater may be automatically controlled.
(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of the station. Limiting the use of a repeater to only certain user stations is permissible.

So, what is wrong with a simplex patch being used as a repeater? It does not say that a repeater has to transmit and receive on different frequencies. So if the patch is set up with the input frequency as the control, and the radio then retransmits that signal (i.e. repeat), wouldn't this be allowable under 97.205.e?

I guess I am confused on how something that is not even mentioned in the rules (a phone patch) can be so clearly ruled out. It seems rather vague to me. I have read over the text several times. Perhaps I am missing something. ANd I admit, even after having it explained several times how a control link is not allowable on 2m, I don't see how it applies.

Furthermore, under S 97.109 Station control, I don't see how a reverse patch from a non-ham is not allowed. In this setup, if a non-ham calls on the patch line, the patch sends one ring out, automatically, as I, the control operator configured it to do. The caller does NOT have control of the radio, nor could they get control of the radio, unless they had
the access codes for remote control operation. They could NOT transmit on the radio, period. They can't even open the squelch, until I, the control operator, give the access code, and identify. The patch line is on a number that only people who have been versed on the Ham Radio operation would be calling.

ANyway, I am not trying to hard headed, but at the same time, I do like things to make sense. Based on what I have read in the rules, it is really a matter of interpretation (aren't they all ;) and that in is case, it boils down to whether the station is an auxiliary or an ancillary function of a repeater. Well, what is a repeater. Does it have to be a device that a club puts up and its input is on a certain frequncy, different from the output? It doesn't say that in the rules. I have looked through the entire book of the ARRL Repeater directory, and it doesn't even define "repeater", although it does refer to it several times as having an input freq, and an output. And I found numerous repeaters listed with the non-standard input off set as the same output frequency, for the 2m band. In fact, I just looked back at one of them, and in the notes, it says that ti has a simplex patch on the repeater. Perhpas there is a disctinction that shoud be made: simplex repeater and duplex repeater, or what ever would denote that it is a split frequency repeater.

Thank you for checking this message,...

I am desperately trying to get service for a Brainstorm Engineering (of Glendale, CA) simplex repeater SR3. I remmenber buying it directly from the company in Glendale, CA. This company advertised the SR3 simplex repeater in QST for some time about 4 or 5 years ago. Now I have searched the Internet, called the phone directory, called the old number and it seems that this company vanished.

Can you help me, by suggesting on how to find this company or then how to seek any service location that would repair this repeater. Thank you,....

434. LMR 400 vs. 9913, Flexible varieties? Cable Maddness!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-08 00:00:00 UTC
From: Drew Loker <Loker@tenet.edu>
Message-ID: <31E05587.4C66@tenet.edu>
Source record: 198362

I posted this in a longer note, and did nto receive any replies. When I searched for it, I couldn't find that the note was ever posted, so let me try this again. I really need some advice here folks!

I am preparing to replace my current 25ft mast to a 50 ft tower. I am currently using RG8 for a dual band Ringo. I am currently planning on switching the RG8 over to the scanner antenna, and running to new leads, one to the vertical RIngo, which will be at the top of the stinger at 60+ ft, and another run to an A148-10s beam that will be located just above the top of the tower. The beam (and consequently, the verticle) will be on a rotor.

I have been trying to select the best cable, but between the various sources having different kinds, and the different places not knowing about the other kinds, it has been a difficult choice. Here are my questions:

1) Is there a flexible version of 9913? (HRO says they have never hear of it, but Cable Xperts and OK Comm Center, sell it.)

2) Is there a flexible version of LMR400? (Again, HRO has never heard of it, and OK Comm Center just doesn't sell it, but Cable XPert lists it, and says that the loss is relatively the same as the normal LMR400.)

3) Would one be better than the other? They are the same price, excpet, OK Comm Center has free shipping, but they do nottcarry the LMR400.

Can somebody please help to clear up this cable maddness????

Thanks!
Drew

Only if the battery was attached, the radio was on, and the PTT was
locked down somehow. <GRIN>

Actually, yes Paul it is common. It is the way the radio comes.
Since it is piece of amateur radio equipment it would stand to reason
that it will only transmit in the amateur radio bands 144-148 and
420-450 out of the box. Actually not sure what the range of the radio
is transmit-wise in the 70cm band without having to look it up.

You will note that the radio specs are only warranted for the amateur
radio service. There is no guarantee that it will do anything outside
the ham bands. We're told, and we just take it for granted, that it
will.

Hi Drew,
I would try to get a copy of the spec sheets from an
Electronics Supply house that might carry Rohn Towers.
Several years ago I was looking at Rohn Tower parts and the
Sales person gave me a complete parts catalog and I
believe that the specifications for the footings and
anchors for down guys were included in the booklet. I
believe that several different applications were diagramed
with in the booklet as well. Good luck with your project.

Source record: 198173

I'm waiting for my IC-706 to arrive next week, so I thought about writing
some software to control the rig. Something like a computer controlled
scan would be nice (having more than the 99 channels to scan here).
That should be easy (You can get the squelch info quite easily).
I also would like to use my computers as a backup for the memories.
Writing the memories to the rig is also easy, but reading is not.
You have to use *UNDOCUMENTED* ?!? functions to read'em!

So does anyone know are there more undocumented control features
(I know about commands 03 (read frequency) and 04 (read mode))?
If so, please mail'em to me. If I get any info I can post a digest
of it.

Also I have a friend who found a better mod for the rx, that enables
One to receive succesfully up to 200MHz (not to 16?MHz, but all the
way up to 200). If anyone is interested I can post the mod
(as soon as I get it myself).

451. hr2510 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-09 00:00:00 UTC
From: hacker <hacker@flash.net>
Message-ID: <31E27707.21C2@flash.net>
Source record: 198179
Body handling: HTML body converted to readable text

could someone please send all possible mods for the 2510?
I heard that there was a mod for 100w pep, for upgrading packet speed,
for external speaker, for even more modulation, and a few others,
this is a fairly decent radio, and even though it is hooked to
a retuned antron 99, I can get contacts with the stock setup quite
well.
thanks in advance for any help.
ps I know that the antron is #1 on change....

I don't have the 50r but have the 51r and had to start out by uploading from
the radio into the computer to tell the program the equipment in the radio.
If you bade any changes in the radio this will have to be reuploaded to thh
computer.

Seems to me that was an old science fair type project, but it also
needed a cat whisker diode as a detector. The razor blade was used as a
transducer (speaker).

Today, anything using a safety razor blade would surely bring on a dozen
lawsuits from cut and slice injuries (maybe we can use the loose
fingertip with fingerNAIL as a core for the tuning coil).

Since I don't wish to be sued I'll pass on giving any further details.

>
> It appears that the 50R will not allow me to monitor a 460
>frequency while transmitting on two meters. Will the 51R? I would like
>to stay with Yaesu as they have the programming software.

My understanding is that the '51R is a true dualband handheld which will allow
the full-duplex, independent band operations you specify (e.g. scan UHF
while operating VHF). In essence, the '51R is a successor to the '530,
which is sitting in my desk drawer next to me as I type...

My understanding is also that the '50R sacrifices this simultaneous two-band
operation for size; in essence, the '50R is like the original Yaesu FT727R, which
allowed operation on only one band at a time, but gave you two bands in
one radio.

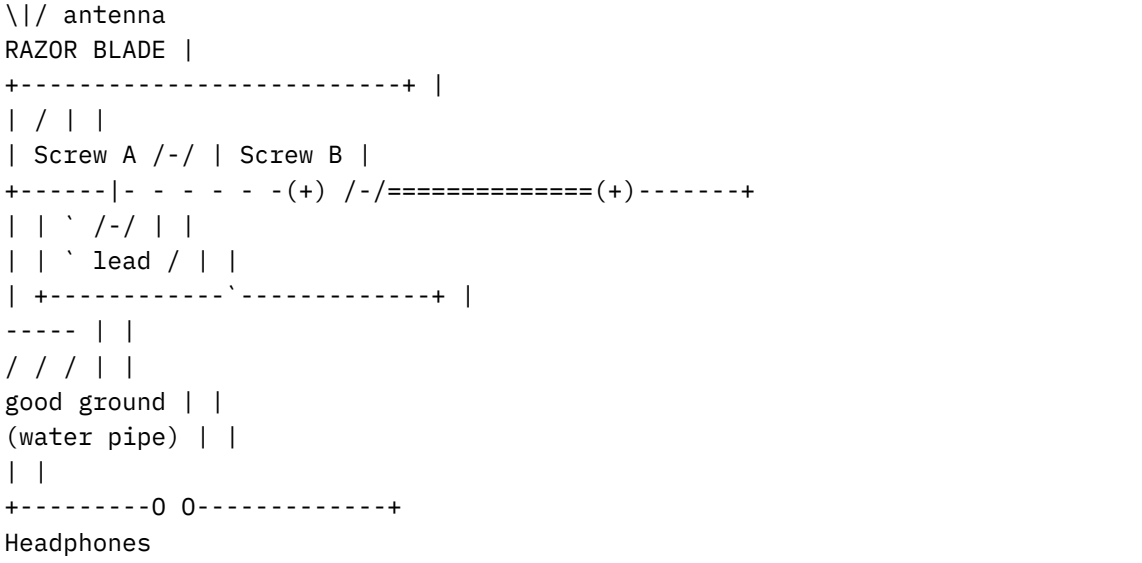
> Jeffrey Weil
> jeffw@shadow.net

I made many of these razor-blade radios as a young boy, from plans in a
Boy's Life magazine. Probably about 1959 or so. They really are amazing.
NO EXTERNAL POWER! I haven't actually built one for years, but need try it
again also!

Here is the basic plan, as I remember it.

Top view: (Sorry for crude ASCII drawing...)



1) Carefully buff the double-edge razor blade with a grindstone to remove
the coating and make it more sensitive.

2) Mount the razor blade loosely on a board, with a 1/2" screw (Screw A)
throught the center hole. Put a couple of washers underneath the blade to
lift it off the board and another washer above the blade.

3) Take two pieces of insulated bell wire about 5" long and remove a 1" piece
of the insulation in the center of each of them.

4) Wrap the bare section of one of the wires around the razor blade screw between the bottom washers that hold it off the board. These two pigtails will be used for connecting to the headphones and ground.

5) Put a couple of washers on another 1/2" screw, and mount it (loosely) to the board about 1/2" away from the edge of the blade.

6) Wrap the bare middle section of the other 5" wire around screw B. These two pigtails will be connected to the headphones and antenna.

7) Get a 3/4" piece of pencil lead. I recommend carving up a wooden pencil (remember those?) so you can get a good strong piece. Sand one end flat (blunt).

8) Cut a bare piece of bell wire, about 2 inches long. Now wrap one end of the wire around the pencil lead about 5 times. (Now you know why the lead needs to be fairly "fat".) The lead should protrude from the bottom of this little coil of wire.

9) Connect the other end of this wire to screw B.

10) Tighten both screws.

11) Bend the piece of wire holding the pencil lead so that the blunt end of the lead rests on the surface of the razor blade with as much surface contact as possible.

12) Connect one of the wires from screw A to a water pipe and one of the wires from screw B to a long piece of wire for an antenna.

13) Connect the other wire from Screw A to one side of the headphones. Connect the other wire from Screw B to the other side of the headphones. (Sorry, I don't have the specs on the kind of headphones to use; I had a cheap pair and they worked fine.)

14) Listen.

To tune the radio, carefully wiggle the lead (or wire holding the lead) and move it around the surface of the razor blade. Let go when you hear music! You should be able to pick up local AM radio stations.

Have fun! Report back if it works!

Bob, I have the SGC coupler which of course is meant in the main to
handle difficult situations like temporary locations,boats,RVs,mobile
and long wires.

It is very well made , performs exceptionally well and I got a good
package with the 706.

This in no way takes away from the value of your advice , but for
some people may add to it.

Tony:

The 706's NB doesn't begin to compare to the Kenwood TS-50S, which is good, but not great. This is a real weak point for mobile operation with the 706. I'm ready to yank it.

I've been told the blanker level can be increased by adjusting R126 on the main unit. I haven't tried this yet but someone I know reports improved performance after adjusting R126. As with most blankers cranking the NB level way up will likely cause some bad side effects (broad RX, etc)

I don't have the service manual so can't comment on exactly were R126 is located or the actual effect of adjusting it.

The Fox River Radio League hamfest is on sunday, July 14, 1996 at
Waubonsee Caommunity College in Sugar Grove, Il.
(Route 47 at Harter Road, Sugar Grove, Il -- 5 miles NW of Aurora).

Talk-In: W9CEQ 147.210 (+600) (PL 103.5/107.2) - AFAR

Door Prizes...grand prize=$400..many more prizes..hourly drawings..

VE Testing at 10am.
No pre-registration required for testing..just bring your original FCC
license (if you have one), a photocopy of your license (if you have a
license), a photo-id and a $6.05 fee.

Advance Tix: $4 (3 stubs)
Gate Tix: $5 (1 stub)

Opens at 8am on Sunday.

Paved flea-market area (free tailgating space with a ticket purchase).
(No food sales...a food vendor will be on-site).

For info, contact Diana (WD9API at 708-293-7485).

You can also respond to this post via email for further info.

thanks and '73

464. FT-50R Serial Numbers?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-09 00:00:00 UTC
From: Bill Crocker <billc@rust.net>
Message-ID: <31E30C84.4EE1@rust.net>
Source record: 198192

I just exchanged a Yaesu FT-50R that I bought last week, for another one. The problem was the light switch button, was like a belly button, sunk in, and not working. The new unit works fine!

This is my question...the serial number on the first one was:

6F****** (newer?)

The serial number on the replacement unit is:

6E****** (older?)

When programming the channels with the software kit, the "F" series started with: CH-00, while the "E" series starts with: CH-01

Anyone know why the difference? Are there other differences?

Thanks, Bill Crocker

465. HTX 212 has poor SWR at both ends of 2m???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-09 00:00:00 UTC
From: Drew Loker <Loker@tenet.edu>
Message-ID: <31E29AD5.3F6D@tenet.edu>
Source record: 198193

I finally got a chance to isolate fluctuation I am having with a Radio SHack 212 that I picked up a couple of weeks ago. At first I thought it was the duplexers or the amp I have in line, but I took everything but the radio out and it is definately the radio.

When transmitting in the middle at 146, it has a very nice SWR, but as I get close to the edges fo the band, it goes up to just over 2. As I aproach the 145 and 147, it starts moving on up 145.5 - 146.5 is all accpetable.

Any ideas? Is this a flaw of the radio? Or is this one defective?

Drew

Hello all...

I am having a problem with an Icom H16 radio of mine. It was left on
overnight and drained its battery down, and now it has lost it's
programming (memory). When I try to reprogram it, it won't let me input
any frequencies below 159 MHz. Is there some sort of code I have to
enter to be able to restore it or a battery inside that I have to change?
Any help would be greatly appreciated. Thanks in advance. Also, please
respond via e-mail to the address below.

How about on the cowl opposite your car radio antenna. they do make
mounting brackets that fit between the hood and the fender for this
purpose.

The Vertex repeaters will interface with the ACC RC85. Our club has 3
Vertex and the controller used is Link Communications RLC-1 and RLC-3.
Link also has a newer model the RLC-Club. They are on the WEB and
advertise in QST. Note: ACC is out of business. Link bought up there
remains, but the old ACC not supported. Good luck.

If you hold down Lamp, PTT, Knob and turn on the radio, after a full reset, it will give you a band number, then HSSQ,THSQ,TISQ,S1LV,S9LV,HIPO,L3PO,L2PO,and L1PO. Be careful on the squelch settings, if you push down the knob while in the squelch settings the radio will start to readjust the squelch settings. Write down the settings BEFORE you start messing with things. If you accidently mess up one setting the squelch will alaways be open (or closed). The S1LV and S9LV adjust the S meters high and low settings.

Thank you for reading my post. I am considering the purchase of a linear amplifier and am thinking of possibly the Ameritron 811 or 811H. I am thinking of keeping the cost down in the intial purchase and in tube replacement(I hear the 811A is relatively inexpensive). I have never owned a linear and am presently in the research phase. I would much appreciate any input as to the performance, good and bad, of these two amplifiers.

I built one of these things when I was a kid. The razor blade (it had to be a blue blade) was used as the detector in place of a diode. It was called a "foxhole radio" because they were presumably used by servicemen during one of the wars. The plans were in a book called "all about radio" which was part of the all about series. I got the book new about 35 years ago (am I that old?) when I was about 7. I don't know whether it is still available or not.

ANY signal sent out on the air BEFORE a control op has screened it (EVEN ONE ring) is illegal...the FCC has stated that many times in the past....no different than a person walking into your shack and keying your radio and hitting a DTMF digit without YOU knowing about it first!
>

The FCC has the say so on interpretation of the rules...no one else!

BTW a repeater can be automatically controlled but any station with third party tfc (patch or otherwise) usually cannot...

> Well, what is a repeater. Does it have to be a device that a club puts up and

I have several counters for sale.

1st:
General Radio Type 1192/z counter w/manual
Freq: DC to 32MHz , 100usec to 10sec counting gate times. Displays Hz, kHz, MHz.
Other specs too numerous to mention. E-mail for more specifics.Was rack mounted so no external case available. Asking $90 plus shipping

2nd:
Fluke model 1900A Multi-counter w/manual
Freq: 5 Hz to 80 MHz
Period: 5 Hz to 1 MHz single and multiple period averages
Totalize: 1 count to 999999 counts
Other specs too numerous to mention. E-mail for more specifics. The handle is missing otherwise in excellent condition. Can be battery operated.
Asking $125 plus shipping

HP 5248M counter -as is- rack mount, no manual, $30 plus shipping

HP 5245L counter -as is- rack mount, no manual, $30 plus shipping

Datum Time Code Translator model 9200, no manual, $20 plus shipping

Systron Donner 8350 Time/Generator, no manual, SOLD

Polarad Modulator Model 1020T, this is a low freq signal generator., no manual, $25 plus shipping

Dranetz Phase meter, series 305, no manual, $20 plus shipping

>KC6VIU

I got this off the net several months ago;

This might help you ..

IC-2340H IC-2350H
Cross Band Repeater Access Codes

FRONT PANEL ACCESS

1. Set the radio for desired frequencies.

2. Push [VHF MAIN], [UHF MAIN], and [SET] simutaneously.

4. To turn off the repeater press [SET] for 1 second.

SETUP FOR REMOTE ACCESS

1. Set the IC-2340H to desired frequencies.

2. Press [DTMF/SCAN] until "REMO" is shown on display.

REMOTE ACCESS (sub band frequency is the control frequency)

1. Enable the control frequency by holding the [MAIN/SUB]. This
will place "SUB" on the display.

2. (Remote Control on) Press [B], {password}**, and [#].
"REMO" and "SUB" will flash on IC-2340H display.

3. (Repeater on) Press [D], [B], and [*].

4. (Repeater off) Press [B], {password}**, and [#]

5. (Remote control off) Press [B], and [*].

** Password is optional if enabled through the setup function of the
radio.

IC-2700H
Cross Band Repeater Access Codes

FRONT PANEL ACCESS

1. Set the radio for desired frequencies.

2. Hang Time- Push and hold [VHF MAIN], [UHF MAIN], and
[SET/LOCK] simultaneously until "L" flashes
on display.
3. No Hang Time- Push and hold [VHF MAIN], [UHF MAIN],
[SET/LOCK], and [DUP/TONE] simultaneously until
"L" flashes on display.

4. To turn off the repeater press [SET/LOCK].

SETUP FOR REMOTE ACCESS

1. Set the IC-2700H to desired frequencies.

2. Press [DTMF/SCAN] until "REMO" is shown on display.

REMOTE ACCESS (sub band frequency is the control frequency)

1. Enable the control frequency by holding the [MAIN/SUB]. This
will place "SUB" on the display.

2. (Remote Control on) Press [B], {password}**, and [#].
"REMO" and "SUB" will flash on IC-2700H display.

3. (Repeater on) Press [D], [B], and [*].

4. (Repeater off) Press [B], {password}**, and [#]

5. (Remote control off) Press [B], and [*].

** Password is optional if enabled through the setup function of the
radio.

IC-820H
Cross Band Repeater Access Codes

1. Add diode on blank position between D27 & D28. Part number is
a 1SS353 P/N 1750000390.

2. Set lock mode by pushing [LOCK].

3. Turn Power off

4. Hold [M/S] and turn on

5. To turn off mini repeater push [LOCK]

IC-281H
Cross Band Repeater Access Codes

FRONT PANEL ACCESS

1. Set both bands to desired operating frequencies.

2. Hold [BAND/SPLIT] and press [[SET/LOCK]. A Flashing "L" will
appear on the display.

3. To turn off the repeater push and hold [SET/LOCK].

The IC-281H will receive on UHF and retransmit on VHF only

From: aharris@newshost.li.net
Message-ID: <4s07to$bcu@linet06.li.net>
Source record: 198117

Hi,

I need to determine the pinout of the microphone connector on the Yaesu FT-2400 2-meter xcvr. Listed below is what I've deduced so far. The wire colors refer to the wires in the mic cable (MH-27 mic).

Pin Wire Function
1 Yellow ????
2 None Rcv Audio
3 Green PTT
4 Clear Tx Audio
5 White Ground
6 Black ??????
7 Blue Up Button
8 Red Down Button

If anyone has a service manual for the FT-2400 (or FT-2500) and can confirm or expand on the above, it will be greatly appreciated.

Thanks,

From: flywheel@ozemail.com.au
Message-ID: <4s09r8$19i@pellew.ntu.edu.au>
Source record: 198123

Hi,

I've been playing with a friend's Kenwood TS-440S
for the past few days, with an eye towards perhaps
buying it. It seems to transmit and receive just
fine -- but it has a most annoying problem with
"key bounce" on most of of the keypad keys. These
include the most frequenly used functions, such as
"RIT", "A/B", "BAND UP/DOWN", and the numeric/mode
keys. A single press of these keys usually results
in 2, 3, or even more repetitions! I've tried pressing
them slowly, quickly, hard, and soft, but still get
flaky results.

Has anyone ever heard of this problem before? Can
it be easily and inexpensively repaired? I believe
the radio has sat idle for the past few months, so
maybe it's a problem with oxidation on the contacts;
although the problem hasn't improved with the past
few days of use.

Thanks and 73's,
Gary.

>
>Any ideas? Is this a flaw of the radio? Or is this one defective?
>
>Drew

Drew, SWR is the way we determine if an antenna system is resonant
at a desired frequency. That is, if the SWR reading is low, the
antenna is said to be "matched." When the SWR reading plotted at
several points across a band indicates a parabola, the lowest point
on the parabola is the point of best match, and roughly the point of
resonance for the antenna system. As you depart from this point of
best match in either direction, the SWR increases. It's not a fault
of the radio or anything else. It's just physics.

Sounds like you might have a 5/8 wave antenna. They're a little
sharper than a quarter wave, but produce effective gain at the
horizon. Set the antenna length to give you the lowest reflected
power reading possible (shoot for less than 2 to 1) in the middle of
your most often used transmit range and ignore the rest.

Enjoy the hobby.

Jim: better check your handbook. As long as the SWR is low,
you can handle the power, it is rated for 1100 to 1500 VRMS
(depending on whose ratings) BUT the loss at 10 MHz is
4 dB/100 ft. That's over half your power. Why not use
RG 58?

The information below came from someone else and I have not used it yet.
He claimed he had used it and it worked fine.
To do cross band on the 2350H you need to do the following:
1) Setup the freqs on each ban as you want them.
2) Press and hold the VHF main and the UHF main and the set buttons for
about 1 second.
3) the memory channels should change to a flashing "L".
4) It is now in the cross band mode.
5) To change it back just press the set button for about 1 second.

There is also a mod to open the radio to 949mhz, but that requires
cutting a jumper. You best ask someone else for the details for that.

>ignition noise level in an auto?

It works okay for me mobile on CW-SSB but I do not have high ignition noise.
That is best cured at the source with resistor wires, plugs, capacitors,
and ground straps. Finding a low-noise vehicle is often the best solution.

The noise blanker does not work at all on AM or FM as defined by Icom for some
reason, who knows? FM is not a problem since the limiter handles that but
excluding the NB from AM mode means that I have to design and mod in my own
NB somehow. Any ideas? The old back-to-back diodes across the detector
output comes to mind, but I'm sure there are much better ways.
I have to buy the service manual for $50!!! Ouch! Ouch! Ouch! First the
mobile bracket for $22 (bent piece of metal, no thumb screws) and now
FIFTY DOLLARS for the schematic!
The squelch on this rig needs an adjustable hysterisis control and more noise
filtering. It keeps popping open even when set very high. This ruins
the scanning features.

Hi Jim, how about starting a low-noise/high-noise vehicle list.
My old '92 S10 would be on the high-noise list. If everyone will
email me their experiences at w6rca@worldnet.att.net I'll keep
a running list and if warranted, will publish it periodically.

Source record: 198132

Hello.

And, yes. My HT did a tripple-gainer face first onto the concrete yesterday. The LCD screen is smashed.

I have ordered the part from East Coast Transistor ($97.60) and will be here in a couple of days. I also have the take-down explosion sheet that shows how all of the boards and hardware comes apart, except for the display unit.

Has anyone replaced one of these yet? With the 79a having such a big display, it makes a hard to miss target for damage. Thus, should be a common occurance.

I just need to know how to carefully separate the LCD unit from the control board, and replace it with the new one.

Thanks in advance.

From: gary@ke4zv.atl.ga.us
Message-ID: <1996Jul10.164936.12053@ke4zv.atl.ga.us>
Source record: 198134

In article <4rjqhg$b03@esgadm.esg.mk.com> tim_shearer@mk.com (Tim Shearer) writes:
>Why do I need a Bird wattmeter ??

It is the standard of the industry. It is the most accurate
power meter you can afford to own, and it is so rugged that
it is a once in a lifetime investment.

>Why would I want to spend $500+ ??

You don't. Pay $100 for a used one.

>These wattmeters must have some characteristics not
>generally understood by most persons. They are only listed
>as having about 5% accuracy, yet they cost a lot and still
>require at least a couple $50 slugs to be useful!

The 5% guaranteed spec is *very* conservative, almost every Bird
I've used has done substantially better than that. The accuracy
spec is basically a result of the analog meter movement. Analog
meter movements can't do much better than 5% of full scale unless
they are individually hand calibrated. That's because they depend
on the particular peculiarities of the individual hairspring in
the movement.

The basic line section and slugs can do much better than the
analog meter movement can show though. You can hand correct the
calibration of the meter movement, or make up a correction chart,
or use a digital meter and a calibration chart, to get better
accuracy. Though you'll almost never *need* better accuracy
than the basic Bird provides right out of the box.

Do you really care if your amp puts out 1000 watts or 1050 watts?
Do you care if your 50 watt radio puts out 50 watts or 52.5 watts?
Or if your HT puts out 5 watts or 5.25 watts? And that's why you
need separate slugs. The meter movement is only guaranteed to give
you 5% of *full scale* accuracy, so you want full scale to be as
close as possible to the power you are measuring, IE if you used
the 50 watt slug to measure your HT, your power output could really
be as much as +/- 2.5 watts from what the meter indicates. But if
you use a 5 watt slug, the maximum error would only be 0.25 watt,
or about 0.21 db. That's what 5% of full scale equates to, 0.21 db.
Most of us will never need better accuracy than that.

Each slug also has a calibration pot (under the label) which can
allow you to precisely set it for a particular power and frequency.
The problem is to find something more accurate than the Bird to use
as a calibration reference. For the two-way industry, a Bird slug

is the calibration reference.

>The internals of these consist of a precise heavily cast
>coaxial section which calibrated slugs fit into...
>
> Does this construction give the wattmeter advantages
> over much cheaper stripline instruments...such as
> immunity to high electric field levels around the meter?

The primary advantage is that it is a precise 50 ohm line section.
It won't introduce mismatches of its own into the system under
measurement.

> Are the many various range slugs...required due to
> the characteristics of the cast coaxial section?
> Cheaper wattmeters cover a much greater range!

And cheaper wattmeters have *much* poorer accuracy. The different
slugs are necessary because different frequency and power levels
require a different width and spacing for the sample loop in order
to get a reading approaching full scale of the meter movement. If
you use an external digital meter with greater range, you can use a
slug outside of its marked power range, but you'll have to work up
your own calibration chart for it. Operating outside the marked
frequency range is possible too, but there will be more nonlinearities
to calibrate out.

>My applications include home use of course but primarily in the
>maintenance of a repeater system. Any of advice about metering
>practice would be appreciated when dealing with all the
>connections in and out of duplexers and amplifiers, etc.

Big subject. The primary thing to remember is to not introduce
matching or phasing problems into the system when inserting the
measuring instrument into the system. The Bird is good here because
it is a precise 50 ohm line section. If you don't require absolute
power measuring accuracy, however, a relative reading stripline
reflectometer can often be used to do "proof" checks on the system
to see if anything has changed since it was tuned up last. As long
as the reading matches the reading you took when everything was
tuned up, the system can be pronounced to be healthy.

>kb7et@usa.pipeline.com

If the SWR is reasonable, it'll handle intermittant 50 watts without arcing over or burning up. But if you're going to use a long run, the insertion loss will kill you, even on HF. If you're only going to need 30 feet or so, it should do fine.

If you figure SWR will be high enough that you'll need a tuner, then you'd better figure you need at least RG-58. But if you are going to use a tuner, then use ladder line instead (flat TV twinlead will do at 50 watts). That'll allow you to use your flattop over a much wider frequency range.

>
>I don't have the service manual so can't comment on exactly were R126 is
>located or the actual effect of adjusting it.

Well, I do have the service manual. R126 is the NB threshold control.
It is set at the factory at -82 dbm. Any noise of lower level than
that will not be "blanked". Since MDS on the receiver is -133 dbm,
the blanker won't start to work until the noise is 61 db higher.
If we believed an S-unit were 6 db, that would put the blanking
threshold at S9+13db. The S-unit on the IC-706 is much less than
6 db, however, so the blanker threshold is more like S9+40 db.

Now if we were to advance the threshold control so that blanking
occurs on weaker noise, it'll also blank on speech peaks of stronger
stations, and that sounds like hell. It would be really nice if this
control were external, but it isn't. If you don't listen to many
strong stations, or if you're willing to turn the blanker off every
time a strong station enters the passband, then you could try advancing
R126.

R126 is on the lower left side of the main board, just below L61.

Source record: 198138

I have just installed my FT-757 HF transceiver in my 1991 Plymouth Voyager. It shares a direct power connection to the battery with my IC-229A 2m mobile. The HF antenna is a Hamstick mounted on the rear bumper. I have the rig grounded to the chassis, the antenna grounded at the bumper, and have strapped the battery ground back to the chassis as well. The problem is that, when operating SSB, I get an audio "trash" sound from the speaker connected to the IC-229A. Its barely audible when the 229 is turned off, but is very loud with in on. I've tried bypassing the 229's power leads and the speaker leads with .1 and .01 mf caps with no luck. There is no problem with the vehicle's AM/FM radio, or with a CD player connected through the cigar lighter. Any ideas would be appreciated.

Source record: 198140

Speaking of Toyata computer noise, my 1989 Oldsmobile Salvage, what the title says, it used to be a Calais ;-) has a horrendus! noise (S9+) on 6 meter SSB when the key is on. This car is so small inside that the rig is mounted within about a foot of the car computer. Does anybody have a suggestion on reducing this? Shielding the computer -- just wrap it in hardware cloth grounded to the firewall, or what? Grounding the doors, hood, & trunk -- I wonder if that would help, as the noise is switched on & off with the ignition. I'd sure like some ideas on fixing this.
Also -- what's a good source for toroids to build a choke in the power cable?

And finally -- this car has a computer that tells the gas mileage, water temp, etc -- when I transmit on 6 SSB at anything over about 2 watts, the display goes black. Will this hurt anything?

Wow! I guess this message is about overstuffed!

My good friend, Rich, KB0IS, (rich-man@juno.com), in Kansas City, MO just hates his IC-2000H due to its intermod problems. Even when he was visiting me here in the wilds of Idaho a couple of months back, it was squawking and beeping to the tune of the not-very-local paging transmitters. It's his first new 2m radio in 20 years and he's talking about getting rid of it.

Of course, if you had an IC-2340H, you're already familiar with the problem (if it's anything like my IC-2350H).

He also had a problem in which the radio would intermittently refuse to power on, but that's probably a "normal" defect, not a design problem.

Sorry that I can't compare the Icom to the Yaesu and Kenwood radios.

Remember, this is K7JD speaking, not my employer, which so graciously provides me with Internet access.

> knowing about it first!

Well, I've never heard the FCC state that before. Reverse autopatches have been, and still are, available on amateur radio repeater controllers. I would think that capability would not be offered if it were not legal for us to use. While I have not seen many reverse patches enabled, I have run across a few.

Here's a different analogy for you: The repeater trustee (with club support if club owned) says, "We'll take responsibility for that ONE "unidentified ring" to be transmitted under my/our callsign (the repeater's callsign)." From that point onward, a control operator may assume the responsibilty on behalf of the trustee/club and answer the call, thereby permitting the 3rd party communication. But this scenario is ALWAYS under "control" except for the initial ring.

Here's an unattended scenario for you: A local no-code tech connects to my VHF packet station and makes contact on HF thru my gateway, where he would otherwise have no privileges... same as an unlicensed person. But I can legally allow this even if I am not present to supervise the contact. Similarly, a no-code tech may operate thru satellite systems that downlink onto the HF bands... with no control operator present to "shut down" the satellite if he otherwise violates any rules.

Chris may limit (by who is authorized to be control ops) or disable entirely the reverse patch on the system on which he is trustee. There is no rules against being "more strict" than the FCC requires. But I think that reverse patches are perfectly legal for those who wish to enable that feature.

Best regards,

Stan/KD9BE

Another point to make here about the construction (and hence the price) of a Bird Wattmeter is that it will be nearly as accurate in a snowstorm at the top of a tower or at a mountain top repeater site in the winter as it is in the desert sun in the summer.

This device is a no-nonsense accurate instrument that can stand up to commercial use (and abuse) everywhere without breaking or lying to you. I know of precious few instruments of ANY type that can make that claim! Plus, you can use it at any frequency you own a slug for, and still maintain decent accuracy over a wide environmental range.

Out of all the SWR/Wattmeter combos I have had or still have, NO TWO will give me the same VSWR or power readings under identical conditions!

The Bird 43 doesn't attempt to give you VSWR, it simply shows you the actual values of forward and reverse power so you can calculate your own accurate VSWR in your head.

516. ICOM Z1A 800Mhz Mod How To?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-10 00:00:00 UTC
From: gandt@ccom.net
Message-ID: <4s1045$a5b@Holly.aa.net>
Source record: 198152

I'm wondering if anyone has performed the 800mhz mod
by adding 2 transistors to the 2f board. So far, I
cannot locate where to place the components.

Any Ideas?

Thanks!

517. Alinco DX-70: Need remote kit and mod info.

Message-ID: <1996Jul10.205807.28152@news.wrc.xerox.com>
Source record: 198153

I just bought a DX-70T and would like to build a quick release bracket for the control head to discourage thieves. The pictures that I have seen of the Alinco separation cable and bracket do not appear to support quick release. Please correct me if this assumption is incorrect. As a real ham (read: cheapskate), I don't want to pay for the separation kit when all I really need is the connectors. Does anyone know of a source for the tiny connectors that are used?
If the Alinco bracket and cable can be quickly removed I won't bother building one. Does anyone know?

Are there any mods to enable out of band transmit. No flames please, I have no desire to operate out of band. However, the ability to transmit on CB channel 9 could be valuable in an emergency.

Thanks for any info,

John

> Rich
> 4X1DA
>

Shalom Rich and good day. I have contacted several colleagues in
JA who are in the amateur radio industry. I am afraid that the
rumor query to my colleagues has been confirmed. I believe it
will be a slow reatreat, kinda like the US company R.L. Drake's retreat
from HF amateur equipemnt in the early 1980's.

The reasons governing the exodous appear to be based on simple economics:

1. prolonged recession in JA hurting Kenwood
2. very low margins on ham gear
3. low volume outside JA due to "codeless" variety of licensing
4. belt tightening / growing cost of R&D to support new technology.
5. better margins on mainstream consumer electronics, video, audio

Given the poor financial performance of Kenwood lately, this had
been in the rumor mill for quite some time. The current JA ham
magazines only are showing 3 basic Kenwood models including the 950SDX,
870, and 450. The ICOM 706 and ALINCO DX70 has killed the TS50 and TS60
series rigs. So, while Kenwood has not totally withdrawn from HF
radio equipment, the writing on the wall is becoming clear.

Good news is that they are not going to exit ham radio entirely. In JA,
as well as the USA, Kenwood has a nice market share in the VHF/UHF end of
the product line. They also do quite well in the commercial business
band radio business.

So...while I am just relaying the hearsay from JA, I believe the rumors
wont prove to be unfounded. Perhaps the weakening Yen will help matters?
On the other hand, perhaps Kenwood can see it's way through these tough
times and reenter the HF radio market at a later date. While this is
unlikely, there's always hope.

I guess it's Icom, Yaesu, or Ten Tec in the very near future.

Vy 73 dit dit,
Joe

Mattstr@primenet.Com wrote:
> Thanks to all who replied to my post. I think I have
settled on N6TR's logging program. It is the only one that
has parallel-port (printer) keying, which is the only kind of
keying that I have ever been able to use with Yaesu transceivers
and my laptop PC.

The SD logger looks fine, but seems to only allow com-port
keying. The modem, mouse, and keyboard all seem to do funny
things when trying to key the radio.

A few questions to N6TR users --- on CT, hitting escape will
stop the CW dead cold. How to do this with N6TR? Also, I
tried the "contest simulation" mode but am curious if I can
make a db file of common ham calls to get used to the program?

Thanks again,
Joe

```
The (In)Complete Guide to the Yaesu FT-50 Version 1.1

Compiled by Bill Childers, KE6VVW

Disclaimer & Other Nonsense
The information in this document is a guide to the FT-50 ONLY.
Having had more than a few radios in my amateur experience, I
understand how most hams wish to learn as much about their rigs as
possible. I have compiled this guide to allow other people to
learn more about the radio without having to search all over for
information. I do not guarantee the validity of this information,
as Yaesu may change programming or hardware so that some of the
techniques in this document may cease to function. I am not
responsible if these instructions damage your rig in some way. All
I can say is that I have performed the following procedures to my
unit, and I am quite pleased with the results. Your mileage may
vary, etc.

History

Version 1.0
1st introduced.

Version 1.1
Added: Game mode, Changed High Power Mod to "Internal System
Alignment". In this section I also detail the squelch and S-meter
adjustments. Also added info to the bug on the FTT-12 Keypad.
```

Introduction
The Yaesu FT-50 is perhaps the most unique VHF/UHF Handheld manufactured today. It's made to MIL-SPEC 810, for dust, splashproofness, and vibration. Out of the box, it has not only dual band 2m/440 capability, but wide FM receive and AM receive as well. In addition, it receives 76-200 MHz, 380-500 MHz, and 700-900 MHz (Cellular Blocked). It has one of the fastest scan speeds for an amateur HT. It also has the unique ability (w/ ADMS-1C software) to interface with an IBM PC running Windows and have memories and settings uploaded/downloaded. In addition, it has DCS (digital coded squelch), ARTS (auto-ranging transpond system), and Yaesu's excellent transmit and receive battery saver features. It also uses Yaesu's extremely efficent FET power module that allows for 5W+ of output power with a 9.6V battery pack. With the optional FTT-12 keypad, the unit also performs CTCSS decode, DTMF paging, and also incorporates a Digital Voice Recorder! All of this functionality in such a small package makes it my rig of choice.

Problems (Bugs)
Unfortunately, the FT-50 is plagued by a few bugs. None of them are very serious or life-threatening, just a bit annoying. First among them is its Wide-FM receive. Apparently Yaesu engineers didn't put a wide enough filter in the unit, and some of the bandwidth of broadcast FM signals gets "chopped off". This means that the rig is near useless for listening to music on the broadcast FM band. It works marginally with voice only on the same band. My opinion on this problem: If you want to listen to music, bring a small Walkman or other transistor radio with you. The 50 does an adequate job of bringing voice signals in on broadcast FM, so it's good for listening to emergency broadcasts.
The second "bug" lies in the optional FTT-12 keypad. The manual for the radio states that you can set up a "voice mail" type of functionality that lets your radio operate unattended and record calls for you. This mode doesn't work correctly, although the built-in voice recorder works great. It seems that the unit will playback the wrong voice partition. The problem appears to be in the DTMF page-answer-back area. If you're buying the 50 and FTT-12 solely for this purpose, DON'T! It doesn't work and there's no current workaround.
The third bug has been complained about a bit. It seems that some 50s suffer from a low Tx audio problem. This is due to a factory adjustment that is set a bit on the low side. It is easily fixed. (See Factory Adjustments below).
The fourth "bug" is synergistic with the ADMS-1C software. If there is some kind of problem in downloading a file to the radio, the software aborts with an error, and the rig is left with it's memories cleared in a "limbo" state. This state is actually the European band plan, and if done properly, the rig can be modified to receive even more frequencies which will be described later. (See modification section) However, if you want to return the rig to its natural state, simply download a blank frequency file (NONAME.RDF) to the unit. All should be well.

Factory adjustments
If your rig suffers from the low Tx audio problem, here's how to fix it.

1. Remove the battery and antenna.
2. Remove the "NiCd" sticker on the heat sink. If you remove it very carefully, it's possible to re-install it later with the same stickum that's on it.
3. Look in the cavity where you removed the sticker. Proceeding from left to right, here's what you'll see
Phillips head Screw (Holds the keypad in)
Small Silver Potentiometer (VR1001VHF Deviation Adjustment)
Small Silver Potentiometer (VR1002UHF Deviation Adjustment)
Small White Potentiometer (TC1001DONT TOUCH! CTCSS Tone

Adjustment!!!)
Phillips head Screw (Holds the keypad in)
4. Take a small Phillips head Screwdriver and turn both VR1001 and VR1002 about 1/8 turn clockwise. This will increase the VHF and UHF deviation and fix the low Tx audio problem. If it's not enough Tx audio, simply turn both pots another 1/8 turn. Make sure to turn both pots the same amount!
5. Replace the NiCd sticker, battery, and antenna.
6. You're Done!

Internal System Alignment (May not work on some radios)
NOTE: This setting appears to work on radios that have NO MEMORIES programmed. You might want to try STEP 3 before clearing your memories. If step 3 doesn't work, you probably need to clear your memories. BE CAREFUL with these settings it's possible to really mess the rig up by setting some funky squelch or something you might want to write the default settings for your rig down.

1. Select 2m VFO frequency.
2. Turn the radio off.
3. Push LAMP, PTT, Knob, and PWR at the same time. The rig will turn on with the squelch open, so turn the volume down!
4. The 50 will display "BAND xxxxxx" where xxxx may differ depending on your radio and whatever mods you may have performed.
5. Turn the top knob. There are a variety of settings available. Here is a listing of them:
- HSSQ: Squelch Hysteresis Adjustment, adjusted by the dial.
- THSQ: Squelch Preset Threshold
- TISQ: Squelch Preset Tight
- S1LV: Low-Scale S-1 Adjustment.
- S9LV: S-Meter Full Scale Adjustment.
- HIPO: Hi Transmit Power Adjustment: Should be calibrated for 5W (Can be pushed higher with a 13.8V Supply)
- L3PO: Level 3 Power Adjustment: Should be adjusted for 2.8W.
- L2PO: Level 2 Power Adjustment: Should be adjusted for 1W.
- L1PO: Level 1 Power Adjustment: Should be adjusted for .1W.

6. Select the adjustment you wish.
7. Push in the Top knob. There will be a "s" that appears next to the displayed number.
8. Rotate the knob to change the setting.
9. Change other settings, if desired.
10. Push the knob for more than 1 sec to save the profile.
11. Select 440 VFO frequency.
12. Repeat Steps 3-10 to adjust the UHF Settings. UHF Settings will have a "U" in front of them.

Modifications
The FT-50 is extremely easy to modify. The first modification is performed for you at the factory but for those of you who accidently disabled it, or changed it here it is.

Extended U.S. Receive Mod (Expands receive from 144-148 & 430-450 to 76-200, 380-500, 800-999 "cell blocked") NOTE: All memories will be erased.
1. Turn the transceiver off.
2. Hold down the Knob and Lamp keys while powering the unit on.
3. The unit now has U.S. Extended Receive.

MARS/CAP mod (Extended Transmit Mod: app. 144-159, 420-470) NOTE: All memories will be erased.
Don't transmit on bands that you're not licensed for!! Besides being illegal, it creates problems for people using those frequencies.
1. Remove battery & antenna
2. Remove NiCd Sticker on Rear Heat Sink
3. Loosen (Don't Remove) Philips head screws on rear that hold keypad in.
4. Use screws as thumb holds to press keypad out.
5. Remove screws.
6. Remove Keypad.
7. Under Keypad on Left Side there is a series of Solder Jumpers. They are labeled in white from 1-3. Only #1 will have solder jumpering it. Remove the solder, being careful not to damage or touch any other components. WARNING: If you're not good at desoldering, or have shaky hands, you might want to have someone else do this for you. It's REAL easy to damage the rig.
8. Reinstall Keypad. Be careful of the O-ring around the keypad. Make sure it's not twisted or damaged, as the waterproofness of the unit could be compromised.
9. Install sticker, battery and antenna.
10. Hold down Knob and Lamp keys while powering the unit on. (Extended Receive Mod as above.)
11. Completed!

Super-Hyper Awesome Mod" The mother of all Mods!!! (Requires ADMS-1C software and MARS/CAP mod to be performed)
Receive: 76-999 Mhz (No displayable holes!!!)
Transmit: 120-221 Mhz, 320-499 Mhz (AGAIN, Don't transmit on frequencies where you're not licensed)
NOTE: This mod will disable ARS (automatic repeater shift) and will set 2m and 440 repeater offset to weird numbers. Make sure you enter repeater offset and +- shift manually. Repeater offset needs be set once for the rig, then it should be able to be forgotten about. It will also clear memories.
Remember above where I mentioned the ADMS-1C software having a bug? Here's where the enterprising and curious ham can take advantage of that. This mod will install the European band plan in your radio"so without the MARS/CAP mod you will lose the top portion of your 2m band.
1. Are there frequencies in your radio? Don't want to lose them? Simply get the data from your radio as it sits" you can "merge" the

frequencies later. Save the file.
2. Perform the MARS/CAP mod as outlined above. Get the data from the mod and name it USA.RDF.
3. Attempt to send the same data to the radio. In the middle of the transfer (around 50%), pull the adapter cable to the PC out of the radio.
4. Thanks to the bug, your radio is now in European mode! Perform the Extended Receive Mod by holding the Knob and Lamp keys down while turning the unit on.
5. Now, the Automatic Repeater offset doesn't work. There's no workaround. Note that the 2m offset has been changed to 0.00. Go to the menu by holding down the knob. Go to SHFT, Option 7. Press the knob. Turn the knob so that it reads 0.60. Press PTT.
6. Now, turn off the radio. Put it back into clone mode. Read the data back from the radio to the PC and save the file as EURO.RDF.
7. If you want to enter frequencies manually or using ADMS as normal, go ahead. Everything should work. If you saved frequencies as above, open EURO.RDF and "merge" the frequencies from your USA.RDF file into it, and save it as another name. Then send the modified EURO.RDF (your filename) file back to the radio using the "template" file EURO.RDF. You're done!
8. To return the radio back to the U.S. band plan, send the USA.RDF file back to it.
Note that I have no way of measuring the sensitivity of the frequencies or the output power of the rig outside of the ham bands. The 220 coverage seems to be very poor, however, the radio does display 220 frequencies. It won't transmit on our 220 bands, though. 800 Mhz receive is vastly improved.

Game Mode
The FT-50R includes an interesting "game" that's programmed into it. Here's how it works:
1. Power up the radio while holding down the MR key. (PWR + MR).
2. The display will show GAME on the left side, and Spd 1 on the right. You're in game mode!
3. By rotating the knob, you can change the speed of the game. Higher numbers are faster.
4. Press PTT to start the game.
5. Numbers will start to scroll across the screen from left-to-right. As they come, you are supposed to push the number on the keypad that makes a sum of ten, followed by F. Example: 6 appears, press 4, F. If 0 appears, enter 10 followed by F.
6. The game is over when the screen fills up with numbers.
7. To exit the game, simply cycle the power.

522. SB-220 to 6M?

From: horse@magg.net
Message-ID: <4ruva9$q2f@dopey.magg.net>
Source record: 198207

Hi,
I am having problems with a piece of equipment that I have.
The item is an MFJ Deluxe VHF/UHF Peak Reading SWR/Wattmeter. I have
it atteched to a Yaesu FT-5100 Dual Band Mobile (2mtr/440). The radio
and antenna sites on the back of the radio are attached correctly, and
the radio has been checked out and is functioning correctly.
However, when I key the mike, the Reflected Power needle moves, but
the Forward Power needle does not move at all. Therefore, it is
impossible to determine the SWR.
Anyway, I've ruled out any problems with the radio or coax
cables/connectors, so the problem is with the meter itself.
I tried to E-Mail MFJ, but their electronic mail server is down.
If you can help, please drop me a line at horse@magg.net
Thanks a lot, Doug (KD4HRT)

How are you measuring the SWR? Are you tranmitting into a dummy load,
or an antenna?

>I refuse to accept that I have to manually turn down the volume on the
>subband when I wish to transmit, and then remember to manually turn the
>volume back up. This is not only stupid, it's darn poor engineering.

It probably is. However, if you read the manual carefully, it
doesn't say it can do that. You assume all radios can do it but it
doesn't. My both 2350H and 2700H both can't do it, and I have to
manually turn it down, my problem is even higher, since I operate on
various crossband repeaters and will have feedback if I don't turn it
down enough, but then I might not hear the other side on the subband
if I can't pick him up on the main band.

However, I don't think it's a bug, it's a lack of feature. I don't
like it but I won't be so harsh. The intermod on the radios deserved
more attention than this, because it annoyed me more.

Either it's some news servers are doubling or you sent this complaint
twice. I already answered the last one and seeing it again.
>Anybody got a suggestion for a fix or mod ?

Now that last phrase, I totally agree with - "but someone else is" is very true. Steve, you might read some of our opinion pieces at www.hamradio-online.com for further thoughts on that.

I completely agree but let's vent our emotional energy fighting real opponents, not ones that don't actually want our ham bands. Teledesic has their allocations at 19 GHz and 29 GHz for wide bandwidth communications.

I am in need of a manual and skematic for a Midland 13-509
crystal-controlled 220 MHz radio. I will take an origanal or a
photocopy. Whatever you have. I can be reached at (919) 965-8309 or
you can send me some e-mail at aaycock@concentric.net

Thanks,

Alan Aycock, KD4CHT

532. Re: Why a Bird Wattmeter ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-11 00:00:00 UTC
From: w8jitom@aol.com
Message-ID: <4s21al$euk@newsbf02.news.aol.com>
Source record: 198066

Duruing the 80's I was Engineering Manager at Prime Instruments. One small part of our business was making meters, including movements. Some of these meters went to the two wattmeter companies in the Cleveland area.

In article <1996Jul10.164936.12053@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us (Gary Coffman) writes:

>The 5% guaranteed spec is *very* conservative, almost every Bird
>I've used has done substantially better than that. The accuracy
>spec is basically a result of the analog meter movement. Analog
>meter movements can't do much better than 5% of full scale unless
>they are individually hand calibrated. That's because they depend
>on the particular peculiarities of the individual hairspring in
>the movement.

All meter movements used by these companies are "hand" calibrated, even the 29 cent battery charger meters were "hand" calibrated. I think what Gary is trying to imply is that non-linearity in the hairspring causes scale tracking errors, but that implication is totally false.

The bulk of the error is not in the hairspings, since a multi-turn spring is a very linear rate component. This is especially true when much less than 180 degrees of movement is applied to a spring capable of being rotated several complete turns before coil bind is reached.

The major part of tracking errors in a meter movement occur from pole alignment and flux distorton in the field surrounding the motor coil. The typical pole pieces used in high quality movements resulted in a tracking error runouts of less than 1/2 percent over the upper 75% of the meter scale in a 120 degree arc movement. Typical resistance and FS current tolerance was less than 1/2% on a 2% meter, and Bird specified 1% or better at 23C. Most meters were within 1/4 % as shipped.

>The basic line section and slugs can do much better than the
>analog meter movement can show though.

The slugs are the bulk of the problem. They show both frequency and power non-linearity. In production environments we use multiple slugs of the same power rating, and somtimes find more than 5% FS error in the readings. Moving the same slug to a different LSU and movement almost always results in the same reading. Slugs are calibrated on a fixed frequency, and the internal adjustments are a compromise between directivity and sensitivity.

Non-linearity (tracking errors) generally occur from diode non-linearity in the slug.

>The meter movement is only guaranteed to give
>you 5% of *full scale* accuracy, so you want full scale to be as
>close as possible to the power you are measuring, IE if you used
>the 50 watt slug to measure your HT, your power output could really
>be as much as +/- 2.5 watts from what the meter indicates. But if
>you use a 5 watt slug, the maximum error would only be 0.25 watt,
>or about 0.21 db. That's what 5% of full scale equates to, 0.21 db.
>Most of us will never need better accuracy than that.

It should be pointed out again it's the slug that is the problem, not the meter. But Gary was correct, the error is 5% of the slug's rating at any point on the meter scale plus a temperature error.

A call to Bird or Coaxial Dynamics would confirm this. The slug is calibrated at the center of the frequency range to be slightly high in reading, and sensitivity typically decreases as frequency is increased or decreased from the center frequency. The calibration tolerance also varies with temperature, and is set at an additional 1% per five degrees C as the temperature varies from 23 degrees C.

533. Icom IC-706 Extended RX mod

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-11 00:00:00 UTC
From: pjka@kanto.cc.jyu.fi
Message-ID: <4s2fb8$rfk@kanto.cc.jyu.fi>
Source record: 198067

Here's the mod I promised for You (it can be found with a
picture pointing out the capcitors at
http://www.jyu.fi/~pjka/IC-706/ic-706rx.html):

= =

Icom IC-706 Extended RX mod
From OH6LGM
Disclaimer:

I'm not responsible for any damage that may result following these
instructions. Remember also, that this modification voids Your warranty.

Icom 706 doesn't out of stock listen to frequencies over 148MHz, although
that is advertised. At Least mine didn't.

Studying the schematics I noticed a front-end filter, that should be
operating in the range of 60MHz - 200MHz. I studied the filter with a
program and noticed, that the passband was 60MHz - 140MHz !! The upper end
was blocked out.

I changed the circuit in a way that enables the radio to work as advertised
by removing Capacitors C53 and C153. Now the filters upper edge is around
230MHz.

This modification doesn't affect 2m RX in anyway, because 2m has its' own,
thight front-end, that is used instead of the modified filter, when in 2m
band. HF and 6m aren't affected either.

The Capacitors are found in the PA UNIT board, behind the external speaker
connector in a relatively easy place.

The job requires cautiousness because the components dislike static and
excessive heat.

This modification works, if the radio isn't already modified with the
modification, which puts 2m front-end in use in frequencies above 144MHz.

At Least My unit worked well with this modification.
Measured from my IC-706:
Frequency Sensitivity (microvolts /20dB SINAD)
60-140 0.14
144-148 0.12
150 0.18
155 0.15
160 0.2
165 0.3

170 0.4
175 0.6
180 1.5
185 1.5
190 >100mV -- deaf!
195 5
200 29

A reverse patch must be answered by an operator before the person
calling can actually have access to the repeater. I don't think it's
illegal. I would assume that the operator that answers the patch
would be responsible for any communications after that point.
Just an opinion though.

539. Need Tone Encoders for older 2M rigs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-11 00:00:00 UTC
From: jimw@cybertron.com
Message-ID: <4s2t8n$1jl@news.cybertron.com>
Source record: 198073

Our local repeater club is considering going to tone encoded system on
our repeater. I have several older radios with no tone board. Is
there an aftermarket manufacturer that makes these for older rigs?
One rig is a KDK with slot for the encoder, but I doubt if it is still
available as the rig is a few years old.
The other rigs are a Kenwood HT, and a Yaesu FT209.

>linear and am presently in the research phase. I would much appreciate any
>input as to the performance, good and bad, of these two amplifiers.
I used the AL811A in conjunction with my TS850S. It was a really solid performer. Loaded up real nicely on all the bands I used it on: 40, 20, 17 & 15 meters, and really helped when conditions were down.

I also used it on the digital modes. The T/R relay in the linear is rugged and dependable.

Overall, the AL811A delivers exactly what it is supposed to: reliable 600 watt output (about 450-500 on digital) at a low cost. And it is true: 600 watts v. 100 watts often makes a huge difference in a contact.

Alas, I'm having to sell mine, as in my brand-new QTH the only antennas I can run are attic antennas. They work real well, but 600 watts that close to the house wiring is making the smoke alarms go bonkers. So I'm gonna be a 100 watt kind of guy again.

Sure will miss that amp.

The first two digits tell everything. The first digit is a number,
indicating the last digit of the YEAR in which it was produced.

The next character is a letter. Take the position of the letter in the
alphabet and subtract TWO (from what I've been told several times)
and that gives you the month of manufacture.

My FT-10 has a serial number of 5I022328. Thus, 1995, I is 9th letter
and the radio was made in 7th month, or July.

since when? I've heard local repeaters call out by digital recordings
for club members. It goes like this, someone calls the repeaters number,
it asks for a code, it asks you to say the call of the person you want
to reach, then the repeater broadcasts, "there is a call for (person
recorded voice)". If that person is on the air, they enter a code and
the call is connected. If there is no reply on air after about a minute,
the caller is told there is no answer and the repeater hangs up. I;m not
sure about the details of how this works because I am not a member of
this club, but I have heard it while monitoring. I don't think they have
someone just sitting at the repeater site all day to connect
patches.(particularly because this site is rather remote)

I read reflectometer to mean the basic $100 type wattmeter most hams have?

>to see if anything has changed since it was tuned up last. As long
>as the reading matches the reading you took when everything was
>tuned up, the system can be pronounced to be healthy.
>
>Gary Coffman KE4ZV | You make it, | Due to provider problems

I understand that placing a 3 db pads inline with wattmeters can swamp out impedance mismatches introduced by the WM. For example to measure the output power of the amplifier (120 watts) place a pad after the WM so that the duplexers see a good 50 ohm input. Where do you get 100 watt attenuators cheaply? Or maybe this is totally unneccessary!

If I had a Bird then I guess this would all be avoided. Right?

Maybe professionals don't have to think about what their instruments cost like hobbyists do. Someone else supplies them the Birds and HP spectrum analyzers they use. This is where my original question came from.

I just want to get relative power readings and trust that they are not in error due to how I've applied the instruments (and without spending a fortune).

Thanks for your insight and experience

Tim KF8XW

>form a telephone, then I do NOT have to have a radio control link at 222 or
>up?

Yes, but if you have a telephone line connection for control, why not
just use it to make the call and avoid the simpatch in the first place?
Note that you must maintain positive control at all times that the system
is active, so you can't just say you'll use the simpatch phone line for
control, you need a *separate* wireline for control.

>Also, as this was brought to my attention earlier, I have read the text of

>431-433 MHz and 435-438 MHz segments.
> (d) An auxiliary station may be automatically controlled.
>
>But is a simplex patch a auxiliary station? Why isn't it a repeater?

No, the simpatch station is not an auxillary station, it is a remotely
controlled station. The auxillary station is the one *controlling* the
remotely controlled simpatch station (if you aren't doing wireline or
local control). If the simpatch station is operating below 222 MHz,
the auxillary station must be a *separate* station operating above
222 MHz. If the simpatch station is operating above 222 MHz, it can
also be the auxillary station for control purposes. It is still
a station operating under remote control, but now the control *can*
legally be on channel.

The simpatch station is not a repeater because it does not *simultaneously*
repeat signals it hears onto a different channel (see 97.3(36) for the
definition of a repeater).

>Under repeater stuff, it says:
>
>S 97.205 Repeater station.

>if the patch is set up with the input frequency as the control, and the radio
>then retransmits that signal (i.e. repeat), wouldn't this be allowable under
>97.205.e?

But a repeater has to *simultaneously* retransmit signals on a different
channel (see 97.3(36)), and the simpatch can't do that. BTW this also means
that a simpeater isn't really a repeater either. It is a voice store and
forward station.

>I guess I am confused on how something that is not even mentioned in the rules
>(a phone patch) can be so clearly ruled out. It seems rather vague to me. I
>have read over the text several times. Perhaps I am missing something. ANd I
>admit, even after having it explained several times how a control link is not
>allowable on 2m, I don't see how it applies.

The simpatch station must have a control operator. If that operator isn't local to the simpatch station, he must exercise control by wireline or by radio. In the latter case, that can only be done via an auxillary station, and auxillary stations aren't permitted below 222 MHz. The fact that a phone patch exists is irrelevant to this fundamental remote control issue. The only effect that the phone patch has is to require operation under third party rules, which *require* the presence of a control operator, either local or remote to the station operating under 3rd party rules, who can exercise immediate and continous control over the transmission of the remotely controlled station.

>Furthermore, under S 97.109 Station control, I don't see how a reverse patch
>from a non-ham is not allowed. In this setup, if a non-ham calls on the patch
>line, the patch sends one ring out, automatically, as I, the control operator
>configured it to do. The caller does NOT have control of the radio, nor could
>they get control of the radio, unless they had
>the access codes for remote control operation. They could NOT transmit on the
>radio, period. They can't even open the squelch, until I, the control
>operator, give the access code, and identify. The patch line is on a number
>that only people who have been versed on the Ham Radio operation would be
>calling.

That's right. The ring is *telemetry*, and that's permitted, whatever the environmental cause that generates it. Reporting that the phone is ringing is no different than reporting that someone has opened the door to the repeater shack, or that AC power has failed and the station is operating off of emergency power. It's telemetry, and telemetry is permitted.

However, once you activate the patch and put the third party on the air, you must maintain *continous and positive* control of the transmission until third party activity ceases. That's where the wireline or auxillary station comes in for a remotely controlled station, repeater or otherwise.

Users can activate a phone patch on a repeater, and that's considered an ancillary function of the repeater. But the user *is not* the control operator, and one *must* be present (even if silently in the background) monitoring and able to instantly control the repeater as long as third party activity is occurring. (Many repeaters operate illegally in this regard, but it is hard to prove that a designated control operator *isn't* lurking in the background doing his duty.)

>ANyway, I am not trying to hard headed, but at the same time, I do like things
>to make sense. Based on what I have read in the rules, it is really a matter
>of interpretation (aren't they all ;) and that in is case, it boils down to
>whether the station is an auxiliary or an ancillary function of a repeater.

No, that's clearcut, ancillary functions are *not* control operator functions. But activation of an ancillary function may require that a real control operator be present and able to positively control matters if the ancillary function activated results in third party operation.

>Well, what is a repeater. Does it have to be a device that a club puts up and
>its input is on a certain frequncy, different from the output? It doesn't say
>that in the rules.

Yes it does. Read 97.3(36) which defines a repeater.

>I have looked through the entire book of the ARRL Repeater
>directory, and it doesn't even define "repeater", although it does refer to it
>several times as having an input freq, and an output. And I found numerous
>repeaters listed with the non-standard input off set as the same output
>frequency, for the 2m band. In fact, I just looked back at one of them, and in
>the notes, it says that ti has a simplex patch on the repeater. Perhpas there
>is a disctinction that shoud be made: simplex repeater and duplex repeater, or
>what ever would denote that it is a split frequency repeater.

Don't fall into the trap of believing the Repeater Directory. It is
full of misinformation (including bogus bandplans). Stick with Part
97. It is unambiguous on these issues.

: me to start out with. I want good quality but, ahem, simplicity. The
: rig will be used primarily on camping trips.

There are some excellent CW kits out there for around $100. I just built a 40m Explorer II from Oak Hills Research. It was really fun to build and has been a blast to operate.

I recently saw a NorCal40 made by Wilderness Radio (Palo Alto, CA) which is really really neat! It has superlow power drain so that you can run this thing off a battery for a long time. It's the smallest and most light weight 40m CW tranceiver around. It's really a clean neat looking radio. I'd highly recommend it.

Check out the following URL for more info:

555. Replacement for RG174

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-11 00:00:00 UTC
From: cbuttsch@slonet.ORG
Message-ID: <Pine.SOL.3.93.960711142652.15922A-100000@spork.callamer.com>
Source record: 198089

If you desire a really light, portable antenna that can withstand some VSWR do not use RG174 for many reasons already mentioned. At least try and locate some small polyethylene 75 ohm parallel transmission line. The most common is Belden 8222 composed of #20 awg conductors and less than a quarter inch wide. If all else fails use some Radio Shack parallel speaker wire (not recommended!). Both are nearly as flexible as RG 174!

Message-ID: <31E51D2D.B1@tenet.edu>
Source record: 198090

>resonance for the antenna system. As you depart from this point of
best match in either direction, the SWR increases. It's not a fault
of the radio or anything else. It's just physics.

Sounds like you might have a 5/8 wave antenna. They're a little
sharper than a quarter wave, but produce effective gain at the
horizon. Set the antenna length to give you the lowest reflected
power reading possible (shoot for less than 2 to 1) in the middle of
your most often used transmit range and ignore the rest.
<

Thanks every one for thew replies on the High SWR at the band edges. I
understand what the situation is. I use 146 the most, and it is tuned
nearly perfectly at this freq.

The antenna, BTW, is a Dual Band Ringo ARX-270. It is about 16ft, with a
gain of 9/12.

Thanks again for the input!
Drew

Unless they are operated under third party rules of Part 97, they are illegal....

> Here's a different analogy for you: The repeater trustee (with club
> support if club owned) says, "We'll take responsibility for that ONE
> "unidentified ring" to be transmitted under my/our callsign (the
> repeater's callsign)." From that point onward, a control operator may
> assume the responsibilty on behalf of the trustee/club and answer the
> call, thereby permitting the 3rd party communication. But this scenario
> is ALWAYS under "control" except for the initial ring.

NOPE...FCC has stated many times that is NOT legal...

> Here's an unattended scenario for you: A local no-code tech connects to
> my VHF packet station and makes contact on HF thru my gateway, where he
> would otherwise have no privileges... same as an unlicensed person. But
> I can legally allow this even if I am not present to supervise the
> contact. Similarly, a no-code tech may operate thru satellite systems
> that downlink onto the HF bands... with no control operator present to
> "shut down" the satellite if he otherwise violates any rules.The VHF to HF gateway may be
technically illegal under Part 97 rules....just because I
can do doesnt make it legal....I know rules were changed recently on unattended
operation of HF packet stations but I dont think VHF-HF gateways were made legal by
that.
The NOCODE tech is operating thru satelite and the callsign of the satelite (Which MUST
be an Extra Class ham) is the one in concern...the user is merely being retransmitted
and EARTH-SPACE oeprations are covered seperately in Part 97 from rptr and aux
operation.
> Chris may limit (by who is authorized to be control ops) or disable
> entirely the reverse patch on the system on which he is trustee. There
> is no rules against being "more strict" than the FCC requires. But I

> think that reverse patches are perfectly legal for those who wish to
> enable that feature.

You obviously have not been licensed since 1977 when the FCC stated in an response to a group's inquiry that reverse autopatch can ONLY be used if the cotnrol op SCREENS THE CALL OFF THE AIR FIRST before ANY signal is transmitted. This has been restated many times in the ARRL book "The FCC Rule Book" which is reviewed and corrected by FCC staff members...
Third party rules are in Part 97 and point out how a station is controlled under such conditions...just because the rules dont specifically state "Reverse autopatches are illegal" doesnt mean they are...in fact, you will find no mention of "remote bases" ANYWHERE in Part 97...but they are legal as stations remotely controlled by AUX stations. Also there is NO mention of AUTOPATCHING to my business in the FCC rules as being illegal....but third party tfc to my business is...and thats what an autopatch is!

I recently built a charger for Gel Cells that was featured in the March 1994 QST. It works great. However there were a few things that anyone building it should know. If anyone is going to build one, feel free to e mail me and ask any questions. A comparable charger goes for about 130.00. I built mine for 50.00. It can also be used for auto and boat batteries..Puts out 1 or 3 amps, then goes to a trickle charge. Very nice but a couple of things you should know....Ron KB6GK

> If you can help, please drop me a line at horse@magg.net
> Thanks a lot, Doug (KD4HRT)

Doug,

I'm not familiar with your MFJ unit, but most VSWR meters have two diode detectors selected by a front panel switch: one for FWD & one for REF. If your meter is like that, you may have a bad diode in the FWD circuit. Disconnect one end of the diode and check it with an ohmmeter for resistance in both directions. One direction should be in the M Ohms and in the other direction in the K Ohms ranges.

Hope this helps,
W0MAY

In article <31E0455B.38B@tenet.edu>, Loker@tenet.edu says...

>But is a simplex patch a auxiliary station? Why isn't it a repeater?

You're right, it is a repeater.

}Under repeater stuff, it says:
}S 97.205 Repeater station.
} (d) A repeater may be automatically controlled.
} (e) Ancillary functions of a repeater that are available to users on the
}input channel are not considered remotely controlled functions of the
^^
}station. Limiting the use of a repeater to only certain user stations is
}permissible.
}So, what is wrong with a simplex patch being used as a repeater?

You're asking the right question. Again, it is a repeater.

>Furthermore, under S 97.109 Station control, I don't see how a reverse
>patch from a non-ham is not allowed. In this setup, if a non-ham calls
>on the patch line, the patch sends one ring out, automatically, as I,
>the control operator configured it to do. The caller does NOT have
>control of the radio, nor could they get control of the radio,
>unless they had the access codes for remote control operation. They
>could NOT transmit on the radio, period. They can't even open the
>squelch, until I, the control operator, give the access code, and
>identify.

Again, you're correct and have obviously set up the reverse patch
correctly.

}... it boils down to
}whether the station is an auxiliary or an ancillary function of a repeater.
}Well, what is a repeater. Does it have to be a device that a club puts up
}and its input is on a certain frequncy, different from the output? It
}doesn't say that in the rules.

You've gotten into a bad habit of being correct and asking further good
questions. Sorry I missed the original response.
Then again I guess I'm glad I missed it.

Now, no one chatize me for this, ...

BUT ....

If you've seen (or about to see) Independence Day (the Movie) HAM Radio & CW seem to save the day. After all other forms of communications have failed or are unreliable, the message seems to get around the country that the U.S. has a plan that might save the planet.

Unrealistic .... the fact that we'd be able to fend off an interstellar attack.

Realistic .... the fact that HAM radio might be useful IF all forms of communications do fail.

Just the fact that HAM Radio is EVEN mentioned in a movie is very pleasing to me !!! Let alone save the world !!! To think, someone actually knows that it exists.

Of course, if we had these local and DX bands taken from us, it woudn't do much good. Don't totally compare this to the movie though. Use your imagination in what could happen (i.e. earthquake, tropical storm, tornado, war ?!?) More than likely, ARS operators are capable and willing to help there country (maybe world, depending on the situation) when all other ways of communicating are down.

I would not reccomend acid as a theft deterrent. I have one thing to say

"Out of sight, out of mind"

Throw a towel or something over the equipment.. It will help keep the
direct sunlight off of the radio and alleviate the thief from seeing what
you have.

Just a thought.

Hi, Why do hams need an accurate measurement of VSWR ? For years we have been told by the experts that absolute accuracy is not worth seeking and in publications like the ARRL "Reflections" we have a full and convincing justification for this. I much prefer an instrument like the MFJ 259 which has helped me more with antenna work than anything other than a Smith Chart in 40 years of hamming.

All,

Hi there, I am looking to buy a flat ribbon style laptop cable for a Dell NX-20 laptop. Any ideas? I wil be willing to buy a dead laptop of the same kind/model if that is what it takes. Please leave me mail here with an idea or if you have one.

Thanks 73s,

Aubrey

Hi Stan, It's dangerous to disguise opinion as legal fact. As an example, Yaesu offered the FT-101 HF transceiver with 11M capability long after amateurs lost that band to CB. Your belief might have gotten you in a bit of trouble had you started calling CQ DE KD9BE with that rig on 11.

>Phone patches are covered as third party traffic.....read that section of Part 97.

Not always. An eligible/designated control operator can use a patch as a
control point. In such situations if he talks on the air while
connected, the phone call is not "third party traffic".

>> Furthermore, under S 97.109 Station control, I don't see how a reverse patch
>> from a non-ham is not allowed. In this setup, if a non-ham calls on the patch
>> line, the patch sends one ring out, automatically, as I, the control operator

>ANY signal sent out on the air BEFORE a control op has screened it (EVEN ONE ring) is
>illegal...the FCC has stated that many times in the past....no different than a person
>walking into your shack and keying your radio and hitting a DTMF digit without YOU
>knowing about it first!

Be careful when you say "ANY signal". That's not true. A control
operator does not have to screen every signal. In fact, on a repeater,
the control op is not repsonsible for certain violations commited by
users when the station is under automatic control and unattended.

As far as the "one ring" thing goes. This goes back the argument over
whether that "ring" signal is simply telemtry that indicates there is
some time of activity on the phone line. I have always contended that it
is telemtry since it not transmitting the ACTUAL ACTIVITY that is on the
line.

>> ANyway, I am not trying to hard headed, but at the same time, I do like things
>> to make sense. Based on what I have read in the rules, it is really a matter
>> of interpretation (aren't they all ;) and that in is case, it boils down to
>> whether the station is an auxiliary or an ancillary function of a repeater.

An autopatch can be considered an ancillary (user) function. Which means
it can be used by a user that is not a control op and the commands for
the patch can run on the input.

>The FCC has the say so on interpretation of the rules...no one else!
>
>BTW a repeater can be automatically controlled but any station with third party tfc
>(patch or otherwise) usually cannot...

Ah! Yes, you are right! And I know of several 2 meter repeaters that
have their patches enabled and used when the control ops are not on the
air at a "remote control point". I bet a lot of people know of machines
like that.

>> Well, what is a repeater. Does it have to be a device that a club puts up and
>> its input is on a certain frequncy, different from the output? It doesn't say
>> that in the rules. I have looked through the entire book of the ARRL Repeater
>> directory, and it doesn't even define "repeater", although it does refer to it

>Check Part 97 under definitions....its there...

97.3 (37) Repeater. An amateur station that simultaneously retransmits
the signals of another amateur station on a different channel or
channels.

For what it's worth - I recommend strongly against a reverse patch that
is available to non hams. Although there are ways to do it right, it is
too easy to violate the little technicalities. If you have a reverse
patch, fine. But I would keep the phone numbers, and certainly ALL
access codes, reserved for designated amateurs only.

If a non-ham wants to call you while you are mobile - get a pager and let
them page you. Then you can use the patch to call them back if you want.
Better yet, forget the use of the patch for non emergencies and get a
cell phone.

>common occurance.

>I just need to know how to carefully separate the LCD unit from the
>control board, and replace it with the new one.

Well, I figured it out.
The LCD is hel in place by a clear plastic retainer that snaps ontp
the edge of the control board. There is also 2 very small leads that
are soldered fron\m the bottom of the LCD unit to the control board (I
believe this is for the backlighting).

Removal:

(Assuming you have taken the rig apart far enough to get to the
display)

1. Carefuly desolder the 2 leads that protrude through the cpu-side of
the control board.

2. Carefuly release both plastic tabs on either side of the LCD unit,
and gently pull the unit toward you. The rubber contact/trace under
the LCD is self sticking and may resist a bit, but will come off.
There are 2 other clear rubber contacts to be wary of, at the very top
of the display retainer, wedged in 2 square loops. These are the
speaker contacts and are not held in place very well.

And that's it. Just by looking at the unit before removal, it looks as
though the keypad and display are linked by the plastic ribbon/traces.
This is not the case. The keypad ribbon is soldered to the control
unit, under the LCD unit.

To install a NEW display:

1. Carefuly remove the rubber contacts from the bottom of the old display. Make sure your hands are clean, and use a small object to help you pry the contact off the glass. (If the contacts get dirty, your display may not function correctly.)
Also remove the 2 rubber contacts for the speaker as well. (Same precautions as above please)

2. Install the rubber contact on the back of the new display. Make sure that the contact seats all the way down in the groove, and is not obstructed by any debris.

3. Being careful to watch the 2 leads on the bottom of the unit, feed the 2 contacts into the holes first, then lay the LCD unit back lining up the rubber contact. Gently snap it into place. Make sure that the rubber contact has not slipped out, and that the WHITE sides of the rubber contact is facing outward.

4. Carefully solder the 2 leads on the CPU side of the control board.

5. Place the 2 speaker rubber/contacts in the square loops on the LCD unit. Make sure that the conductive side of the rubber contact is facing up. You can tell by looking at the sides of them. 2 of the sides will have a lighter colored inside layer. One side should be facing the contacts on the control PCB, the other facing up toward you. (To make contact with the speaker assy.)

The rest you should already be familiar with.

(Remember to watch out for the mic when placing the plastic slide over the keypad traces.)

Hope this helps anyone trying to "fix-it-yourself"..

Rob Neff (N7ORY)

P.s. I hope I never have to replace THIS display again.

> Bill W0IYH

Hi Bill, Yes I agree but medium priced meters,such as,Kenwood,
Daiwa,etc. have sufficient accuracy to permit adjustment to better
than about 1.3:1 except at very low power levels. Measurements below
1.3:1 must be doubtful anyway considering the other factors involved.
Of course the SWR meter in the rig is fine if people reduce power
manually for the initial adjustment...and increase for final tuning.
The Bird is a super meter and for professionals or bench work (and
for pride of ownwership) is ideal. A bit like owning a Leica!

I haven't seen any such posting and have to say that I doubt it.
The filtering seems to peter out well before the 200 MHz that it is
presently spec'ed for. I can't see that it would hear much even if the
VCO's were able to go much beyond the current limit.

Admittedly, it would have been a real bonus if the 225 MHz band could
have been squeeked in ! :)

Cheers,
Hugh Duff VA3TO Toronto

To fix the rig:
You must upload the USA file while having the template box checked.
Specify the European Template in the browse template window. This
tells the software that you are uploading a file to the European
version radio. This should fix it.

Dennis,

I don't know for sure, and have the same question
with my Kenwood TH-79. It seems to me that the
battery *would* eventually overcharge -- just the
same as if you'd plugged in the cheap wall charger
that comes with the radio. After all, 12 volts is
12 volts.

In fact, that brings up another question. I have
a snap-apart battery pack that holds 4 "AA" alkaline
batteries. Can these be damaged by plugging in the
car battery adapter or the wall adapter? The salesman
at HRO thought that there might be extra contacts
on the battery pack which tell the radio that it's
not a standard ni-cad pack; but I don't see anything
different.

Hi Tim,
In article <4s39mk$f46@esgadm.esg.mk.com>, tim_shearer@mk.com (Tim Shearer) writes:

Gary's overview of meters and their use was right on target, even though the technical explaination of the cause of inaccuracy wasn't quite correct. Let me add a few more comments to this.

>I understand that placing a 3 db pads inline with wattmeters can swamp out
>impedance mismatches introduced by the WM.

I can't think of any exception to this fact.....If the wattmeter inserts a large enough "bump" to require a 3dB pad, it won't be accurate for power or SWR measurements.

There is only one condition where such a poorly designed meter could accurately read the load power and SWR. That is when all of the impedance mismatch comes from the connection between the RF directional coupler circuit and the RF input connector. Even in that case, there is no way to read transmitter power correctly.

If any of the mismatch is actually in the directional coupler, or in the line between the directional coupler circuit and output connector, both power readings and SWR readings will be unreliable.

> For example to measure the
>output power of the amplifier (120 watts) place a pad after the WM so that
>the duplexers see a good 50 ohm input. Where do you get 100 watt attenuators
>cheaply?

Unfortunately a 3 dB pad is only a 3 dB pad when the "load" is equal to the pad's design value. While the source impedance can be anything without affecting pad attenuation, the load impedance can not. The pad will improve things slightly for the TX and cavity, but the meter will remain just as inaccurate and unreliable.

You'd have no idea how much attenuation the pad was producing and how much power the TX system was delivering.

>I just want to get relative power readings and trust that they are not in
>error
>due to how I've applied the instruments (and without spending a fortune).

Then you need a cheap but reasonably accurate VHF meter, and there are several types much less expensive than the Bird and Coaxial Dynamics meters. You could borrow or buy a used Bird or Coaxial Dynamics meter.

As for other brands, ask around. I'm sure there are several types available. I tested a Taiwanese manufactured wattmeter a year or two ago, and it was within 5% full scale even on 450 MHz. If you'd like, I can see if I still have the name somewhere. Of course remember, it was only ONE sample so others may be a bit worse.

I have recently bought a secondhand Kenwood TH78A. 2M/70cm HT.
I have performed the mod discribed in the QRZ www site mods directory
for extended receiver coverage.

I have found the RX to cover the ranges as specified in the mod but
the UHF sensitivity is very low above 460Mhz.

If you have performed this mod on your TH78 I would be interested in
comparing notes.

Best Regards.

Andrew Albinson.

> Hi, Why do hams need an accurate measurement of VSWR ?

With solid state power amplifiers it is desirable to have fairly good accuracy below the 3:1 range because these amplifiers require low SWR. In particular, they like pure resistance.

Source record: 198024

The AH-3 is for random wires only. so is no good with coax fed antennas. By the way, as far as matching and interconnection capabilities, the AH-2 is the same, and if you are lucky, an AH-2 can be found for less than the AH-3, even though it was initially quite a bit more expensive. The difference is the AH-2 has an external controller that connects to the radio and AH-2 ATU. The controller is not needed with the 706 and some other more modern ICOM rigs. The 706 has the "brains" built in to control the ATU.

Actually, you don't even need the battery...! The schematic is
exactly like an old crystal radio, a coil (or loopstick) and capacitor
tuned to resonate in the AM band, a length of wire for the antenna and
the razor blade in place of the crystal (or diode) as the detector, and
an earphone . The "GOTCHA" is the razor blade has to be (IF they still
make them!!) a Gilette "Blue Blade". This type of blade had a coating
(plating?) that would allow the blade to act as a rectifier. Contact to
the blade was made with a wire connected to the blade and a sharpend
graphite core, from a pencil, with a few turns of wire around it to let
you connect it to your circuit. I built one of these when I was a kid
(don't ask me how long ago :)) and as I recall it worked fine, but you
did have to "hunt around" on the surface of the blade to find a spot that
would work as a rectifier. Good luck and have fun.

The radio FT50R, there are three different contacts that the battery pack plugs
in to. The radio supplys the charge current and the "12V" plug can accept up
to 14 volts per the manual. Therefore, the radio regulated the voltage to
charge the battery and the needed current. The down side to keeping the radio
pluged into the car is that the ni-cad will if not used alot will build up
cristals that will short the ni-cad pack out and shorten its life and the
charge that it can hold. I suggest removing any ni-cad pack when using car
power, or an external power supply.

I put one of these radios together when I was a kid. It is a crystal
radio but you use a razor blade in place of the crystal & use a safety
pin for the cats whisker. If I remember right you need one of the old
brown razor blades. I don't know if they are still made.

John,

You may want to check with your news provider. I have never had any
trouble retrieving an article here. I do check every few days, though,
since they can add up to a couple of hundred in less than a week.
Maybe others will comment on whether this is a common problem.

That's about it. There is no magic wand for receiving distant UHF
signals. You just need a high gain antenna mounted as high and in
the clear as possible, and a mast mounted preamp to overcome the
feedline losses to the set.

Gary

>would be appreciated.

Try this test. Disconnect the 2m antenna coax from the IC-229A. If
the problem goes away, make a choke balun by tightly coiling several
turns of the 2m coax just before it enters the radio. If disconnecting
the coax doesn't make the problem go away, try a hash choke in series
with the 2m radio's power lead (right at the radio). You have a "ground
loop" for HF energy with the 2m radio somewhere in the loop. You have
to "break" the loop with a choke. Bypass capacitors alone usually won't
do the job.

>Karamanos to fork it over. He is a ham too (wd6dih).

Most of the receiver internal noise comes (unsurprisingly) from
the section of the receiver with the most gain. That's usually
the IF and not the front end. Now having the front end run at
maximum gain can amplify *external* noise, IE atmospheric and
manmade noises, but it won't usually be the major noise contributor
to a HF receiver. (That's not the case at VHF/UHF where the external
noise temperature is low, but at HF the external noise temperature will
be 10,000 K or greater, and that totally dominates front end noise.)
At HF, a front end attenuator will handle that externally generated
noise as well as a RF gain control would (except that a typical RF
gain control circuit would turn down IF gain as well as RF gain,
and thus also attack the major internal noise source of the receiver).

>blanking on speech peaks of stronger signals is a potential problem,
>would using the attenuator serve the same purpose without losing the
>use of the NB altogether?

I have tried adjusting R126. It has the defect I mentioned with strong signals. Using the attenuator knocks down both the noise and the signal. You still need a difference between the signal and noise levels. Setting the threshold in that gap lets the blanker deal with the noise but not the signal peaks. If that gap isn't there, then attenuator settings have no useful effect.

Note that this isn't a very good noise blanker design. For one thing, it operates after the 9 MHz second IF filter. It would be more effective in the 69 MHz first IF, or at least *before* the 9 MHz SSB filter. Looking at the schematic, it seems like it would be trivial to move the noise amp pickoff from after the 9 MHz filter to before the 9 MHz filter. That should improve blanker performance markedly. (I haven't tried this yet, but theory says it will work. The narrow filter "smears" noise pulses, lowering their peaks and reducing the difference between noise and signal, IE narrows the "gap" mentioned above.)

If some brave soul wants to cut the noise amp input trace and jumper it to before the filter rather than after it, I'd like to hear about the results.

In article <31E3F660.1811@ix.netcom.com> "William M. Bickley KF2ON"
<wbickle@ix.netcom.com> writes:
>
>Can someone point me to specific info on the details of the (in)famous yellow wire mod
>for the IC-706 which opens up Receive above 129MHz?

Remove the radio top cover. With the radio faceplate facing you,
you'll see a multiconductor plug near the middle of the radio.
The fourth wire from the *left* is yellow. Remove this wire from
the connector and tape it off, or cut it, and you've done the
yellow wire mod (type 1). Be careful, there's also a yellow
wire fourth from the *right*, that's not the one you want.

What this mod does is force the radio to use the 2m bandpass
filter all the time rather than just in the range 144-148 MHz.
The "wideband" filter that would normally be selected outside
the 2m band actually cuts off at about 140 MHz, so you can't
receive signals above the 2m band (such as national wx at
162.55 MHz) with the stock radio. After the mod, the 2m BP
filter has wide enough skirts to allow you to receive national
wx, but peters out above that.

There's a downside to this (type 1) yellow wire mod. After
the mod, signals in the aircraft band will be greatly
attenuated. That's because the lower skirt of the 2m BP
filter (now used all the time) peters out at about 130 MHz.
To avoid this problem, there is a type 2 yellow wire mod.

In this latter mod, you take the yellow wire you disconnected
in the type 1 mod and extend it to the bottom of the radio
and connect it to a switching transistor there. Remove the
radio bottom cover. You'll see 5 SMD transistors just behind
the front panel menu key. The center transistor has a trace
going over to a feedthru hole near a coax connector on the
right side of the board. Solder the extended yellow wire
to this feedthru hole. Now when you tune *below* 2m, the
original "wideband" receiving filter will be switched in
and you'll have restored aircraft band sensitivity. Above
2m, the 2m BP filter is still used, so you'll still be able
to pick up national wx.

There is a different solution, other than messing with yellow
wires, to the problem which can give you coverage all the way
to the 200 MHz upper tuning limit of the radio. This mod requires
you to modify the "wideband" filter so that it actually cuts off
above 200 MHz as it should. This mod requires removing two SMD

capacitors in the filter (and optionally piggybacking one of them
back on top of another capacitor). The former mod is simpler since
you don't have to worry about damaging the removed capacitors, but
can cause image problems. To do either version of this mod, you
really need the service manual's parts layout diagram. It is
difficult to explain exactly where these capacitors are without
a drawing. (Needless to say, you should also have some SMD rework
experience to perform this mod.)

I had called Yaesu about this when I first purchased the radio. They said they are thinking of coming out with a dummy back cover to use on the Ft50 when using it with external power. Let them know you are interested in one. I dont know their email address but I gave them a call. Also I asked about the other problems mention on the net and they informed me it was printer error in the manual. I dont by that but thats what the tech rep told me.

Again, I will state what the FCC has said (not an exact quote):

NO signal may be transmitted by an amateur station BEFORE a control op
screens the call off the air. This includes RINGING, beeps, or any other
signal designed to get the amateurs attention....EVEN a carrier being
transmitted with NO tone, etc is in violation...

(if a non ham walks into your room and KEYS the mic or CW key without
your knowledge FIRST, its illegal....same for reverse autoptach...
YOU can try to justify it all you wish....but the Commission's ruling on
it is the law and final)

Heck a lot of gateway operations of 2m to HF packet have been illegal for
years! (Technology always exceeds the law) but that MAY have changed due
to recent rules concerning AX25 and unattended operation...if it has or
hasnt, I bet NOONE doing it has bothered to check the rules anyway.

>The other rigs are a Kenwood HT, and a Yaesu FT209.

Circuit Specialists makes several encoders and decoders. Some are
small enough to fit into a HT. The downside is the need to set the
DIP switch for the tone you want. They have an external box too,
with a knob, but it isn't the best choice for most rigs. HRO carries
them as stock items. They aren't too expensive.

Well, unless you have a perfectly matched load and have the meter
connected backwards (it could happen), the most likely problem is
a burned out forward power diode. To check the obvious, try reversing
the coaxes to the meter. If forward now reads and reverse does not,
you've found the problem. Otherwise, open up the meter and check the
diodes with a VOM.

Really? 29 cent meters are individually hand calibrated? Must have
laborers willing to work well below minimum wage. :-) The cheap
meters I see seem to have mass printed scales. I know that some
high end meters are machine calibrated.

If I implied that the Hooke constant of the hairspring was non-linear,
I didn't mean to. What I meant to imply was that the value of the
Hooke constant for individual mass produced springs varies from unit
to unit. That gives an offset to the reading over the entire range
which isn't compensated by the zero adjustment, but not a non-linear
error.

>The major part of tracking errors in a meter movement occur from pole

That's impressive. Wish my Simpson 260 had a meter movement that good.
It is specified as 3%.

>always results in the same reading. Slugs are calibrated on a fixed
>frequency, and the internal adjustments are a compromise between
>directivity and sensitivity.

Right, but you can create a calibration chart for individual slugs
which will allow you to use them to a greater accuracy than just
reading the meter will give you. I didn't know that the Bird meter
movements were as good as you say, but I did know that you can use
a digital meter and a conversion chart made for that slug which will
give you much better than 5% accruacy. It is the precision of the
line section and slug which allows you to do that, even at UHF,
IE performance is very repeatable.

I have a bare line section holding two slugs (forward and reverse)
connected to digital meters with RS-232 outputs which feed a PC.
The PC displays the forward and reverse power and a calculated VSWR
using a calibration table stored on disk. I get better than 1% from
100 to 10,000 watts (or so I thought, see below).

>Non-linearity (tracking errors) generally occur from diode non-linearity
>in the slug.

Yes, and it is worst at the low end of the scale. That's another reason
why you want to use a slug that will produce almost a full scale reading
for the power you want to measure. Or an individually created calibration
chart that relates voltage read to actual power measured. (You don't
really care if the diode is in its square law region if you have a
calibration chart on it.)

>A call to Bird or Coaxial Dynamics would confirm this. The slug is
>calibrated at the center of the frequency range to be slightly high in
>reading, and sensitivity typically decreases as frequency is increased or
>decreased from the center frequency. The calibration tolerance also varies
>with temperature, and is set at an additional 1% per five degrees C as the
>temperature varies from 23 degrees C.

I didn't know about the temperature effect. That's useful info. I think
I need to add a temperature compensation to the tables for the system
I described. Maybe not though. I calibrated it with a calorimeter (water
load) and let the temperature stablize for each calibration point. That
doesn't consider ambient, but the setup is in an air conditioned room
so ambient stays in the 70 F to 72 F range year round.

>Just an opinion though.

The repeater is merely reporting telemetry as it was programmed to
do when it signals that the phone is ringing. That's as legal as
any other telemetry status reported by the repeater, and telemetry
is legal. When an operator activates the patch, however, third
party traffic starts and a *control* operator for the repeater must
be monitoring and able to take immediate action, just as he must if
an operator had activated the patch to make a call rather than to
answer one. There is no difference. The user doing the patch is
usually *not* the repeater's designated control operator, though
in some cases he may be.

Note that in an ordinary outgoing patch the control operator screens
NOTHING before it goes on the air, because he doesn't hear anything
before it goes on the air and is monitored at the control point where
he is. A. Prose Walker generated a lot of wacky opinions related to
repeaters (and saddled us with some ridiculous rules) when he ran
the amateur branch of the FCC, but he's gone now, and the rules have
been through two rewrites since his tenure. The current rules recognize
programmed computer control, recognize that telemetry is permitted under
programmed control, and recognize that a control operator can only take
action *after* he hears an infraction. The rules do insist that he do so
immediately, however, which is why the control point must have positive
and immediate control.

Let me repeat, however, the person doing the patch is usually *not*
the control operator for the repeater. This seems to cause an unusual
amount of confusion. It shouldn't. The rules are clear, a control operator
designated by the repeater trustee, and listed as such in the station
records, (or the trustee himself) *must* be at a control point any time

third party traffic is being conducted. The amateur repeater user is party one, the control operator of the repeater is party two, and the person on the patch is party three. *Three* parties, that's why it is called third party traffic.

No, it isn't. Read the definition of repeater in 97.3(36).

>Can we confirm this?

I don't know if the rumor is true, but I do know that the wideband receive filter in the radio cuts off at about 140 MHz, so even if the radio would tune up there, you won't hear anything unless you modify the filter. (And the transmit lowpass filter too, it's in the signal path and it cuts off below 250 MHz.)

>>One rig is a KDK with slot for the encoder, but I doubt if it is still
>>available as the rig is a few years old.
>>The other rigs are a Kenwood HT, and a Yaesu FT209.

Our club also has (and still occasionally is) adding PL boards to
radios. We've used Communications Specialists in most cases, and have
had good luck with them. They make 3 or 4 models in different sizes
for about $27 each, one even small enough to fit inside of an Icom
IC-2AT!

There are several companies that make similar boards, and I think all
of them ate probably OK. I'm not a big fan of the ones you tune with
a trimmer pot. DIP switch or solder bridge programming is the way to
go, because no frequency counter is required. Just set the switches
and go.

From: Dan Ellefson <sl3jj@cc.usu.edu>
Message-ID: <31E6C12D.5C04@cc.usu.edu>
Source record: 198059

FOR SALE: HEWLETT PACKARD 1740A ANALOG 100Mhz OSCILLOSCOPE

The unit is a two channel 100 Mhz oscilloscope with two external triggers.
It comes with two HP X10 probes that came with the scope and two B&K X10/X1 probes
that I bought brand new. All the probes are rated at 100 Mhz. The scope is capable
of deflection factors from 1 mV/div to 20 V/div on the vertical scale and 5 ns/div to
20 s/div on the horizontal scale. The scope also has a delayed sweep feature which is
set by a precision control knob which allows delay settings of 50 ns to 20 s. Other
features of the 1740A include simultanous display of both input channels and the trigger,
bandwidth limit control for attenuation of signals above 20 Mhz, plotting channel A vs B,
choice of 50 Ohm or 1 Megohm input impedance, Chop mode, Alt mode, A+B display, channel
B inversion (this allows A-B display), trigger selction of channel A, B, or external,
trigger level control,LF and HF reject on external trigger inputs, AC, DC, Internal and
External triggering, External /10 triggering, and many more features.
Documentation for the scope is included and consists of the 1740A Operator's Guide
and the 1740A Operating and Service Manual with includes detailed schematics of the scope's
internal circuitry.
The scope comes with a soft leather pouch with a velcro closure that is attached
to the top of the unit allowing storage of manuals and probes. A hard plastic cover is
also included that fits snugly over the front face of the scope to protect the controls
and CRT.
The scope is in very good condition with no noticable dents or scratches. I've had
the scope for quite some time and have been very pleased with its performance and the great
many features that come with it. The reason that I am parting with it is because I recently
purchased a brand new $4500 scope (ouch....) and have no need for two scopes.

PRICE: $450 (buyer pays for shipping)

Contact Dan at (801) 787-4374 or EMail me at sl3jj@cc.usu.edu

In article <4s65sd$o2i@mtinsc01-mgt.ops.worldnet.att.net>, Lagnar
<LAGNAR@worldnet.att.net> writes
>Does anyone have experience with the new NMH batteries for hand held
>radios? Specifically, will my NiCd quick charger damage them?
>
I have been using 1.1/1.2AH NiMH AA cells for a couple of years in
handheld radios (using the supplied AA-cell case in some instances, and
also re-celling a NiCd pack with tagged NiMHs in another). The NiMH
cells are good provided usage is mostly Rx; recovered capacity can drop
quite a bit if a lot of Tx is done, i.e they don't like high current
drains. Their internal resistance is a bit higher than NiCd too (Use QRP
whenever you can). They also have considerably greater self-discharge
rates than NiCd; up to half their capacity in a week or so, perhaps
more. This effect lessens after several charge/discharge cycles.

It is not really advisable for best results to charge NiMH cells at
rates higher than around C/10; I stick to that rate myself, using home
built constant current chargers mostly. One great advantage is freedom
from memory effect, and acceptance of _low-rate_ overcharge without
apparent damage. I regularly top-up the 6-cell NiMH AA packs used with
my handhelds, and have no capacity/memory problems at all. They are also
good in portable consumer electronics, giving the expected extra usage
time for the higher capacity; no high Tx currents here.

I would definitely _not_ use your 'quick' NiCd charger on NiMHs; it will
almost certainly damage, and could well destroy them, including causing
bursting and release of electrolyte. My supplier showed me some cells
returned by aeromodellers which had been fast-charged (though at rates
acceptable for fully-discharged NiCd cells) and were grossly physically
swollen and distorted; they had tried to treat them like NiCd and paid
the price. Used with care, though, they are fine.

Hope this helps.

Hi Steve,

The strangest case I have heard about from your side of the pond, was reported in "Flyer" magazine. The customer sued Robinson helcopters because he claimed that the throttle control was not strong enough, it broke and this caused the helecopter to lose power and crash - Fair comment, BUT the guy had taken a loaded 12 gauge shotgun with him, this had gone off accidentally, and the un-checked recoil smashed the butt into the throttle quadrant.

Now why the hell didn't Robinson make their aircraft shotgun proof!!!

They are out there Steve!

Best regards

>ed.welch@cheaha.com

Ed,

I would STRONGLY recomend the Nor Cal 40A. It is a good little
radio that is quite straight forward to assemble. There is NO chasis
wiring (Often a source of headaches) the case built such that the
connectors stick off the circuit board and through the cabnet. It is
available from Wilderness Radio, P.O. Box 734 Los Altos, CA 94023-0734,
(415) 494 3806.

Just TAKE YOUR TIME and enjoy building it!

73,
Joe ka0yos

Well the 2350 H is not designed to have VHF-VHF .. UHF-UHF. Not sure what
might have happened. The 2700 H and 2710 H do support the VHF-VHF and UHF-UHF
receiver capability.

Gary

Check the internal lithium battery it should be 3 volts. Then you will need to find a good operating H-16 with an OPC-129 cloning cable. Cloning the radio form a correct operating one is the ONLY way to recover operation. There is NO CPU reset other than cloning from another radio. ICOM will do this for you, but the charge is 1 hour labor $ 75.00 plus return shipping.

Gary

649. Re: ICOM IC-761 Help

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-12 00:00:00 UTC
From: gfiber@halcyon.com
Message-ID: <4s4goh$ckr@news.halcyon.com>
Source record: 198113

The following may give some insight about your IC-761 troubles.

Best Regards,

Gary

Most Common Failures and Cures for the Icom IC-761

Symptom: Garbled RX/TX, or no RX/TX on one or more bands.
Problem may be temperature related.
Probable Causes: 1) Bad trimmer capacitors on PLL unit. 2)
Noisy variable resistor on PLL unit.
Cure: Replace plastic trimmer capacitors C78, C88, C97, and
C107 with ceramic equivalents. Remove excessive wax from
around replacement trimmers to prevent wax contamination.
We suggest using a 12pf trimmer for C97 instead of a 7pf as
listed in the service manual. This will allow you to
properly adjust the HPL lock voltage for that band. Also,
replace variable resistor R43 on the PLL unit with a fixed-
value, 220 ohm, 1/2 watt version. (Use a 1.2k resistor if
the value of R43 variable resistor is 2.2k.)
Remarks: While the PLL unit is lifted, we recommend
resoldering the joints in the regulator section as this area
runs hot. Also, inspect electrolytic capacitors C128, C129,
C132, and C137 in the regulator circuit for discoloration
caused by overheating. Replace all overheated capacitors.

Symptom: Frequency unstable in USB mode.
Probable Cause: Bad trimmer capacitor C202 in BFO section
on main unit.
Cure: Replace plastic trimmer capacitor with a 30pf
ceramic trimmer and re-align.

Symptom: No or very low RX sensitivity.
Probable Cause: Bad components on RF unit, probable result
of RF overload. To verify this, check DC voltages at D47 on
RF unit. Correct voltages are: Cathode side- RX: 8.5, TX:
13.8. Anode side- RX: 9.0, TX: 9.5.
Cure: Replace all of these components on the RF unit: D42,
D44, D45, D46, D47, Q15. Check C174 and C179 for leakiness.
There may be other failures. Unit is not repaired until
listed voltages at D47 are correct.

Symptom: Distorted RX on strong signals. BC band RX
sensitivity may be low or marginal.
Probable Cause: Q15 on the RF unit has become leaky.

Cure: Replace faulty Q15 (2SC2878B). If Q15 is leaky, there may be other problems on the RF unit. See cure for RX problem listed above.

Symptom: Intermittent RX sensitivity. Problem seems mechanical. Banging on case or switching between RX & TX may temporarily restore sensitivity.
Probable Cause: Intermittent contacts in relay on tuner relay unit.
Cure: Replace RL13 (LY2-0-DC12V) on tuner relay unit.

Symptom: Noise in RX, birdies.
Probable Cause: Voltage regulators on PLL unit are oscillating.
Cure: Replace overheated C128, C129, C132 and C137 regulator filter capacitors on PLL unit.

Symptom: RX disappears when outer shield of antenna coax is connected. Inspection reveals 6 volts DC at the center conductor of the antenna jack.
Probable Cause: Shorted DC-blocking capacitor C40 on the ANT SW unit.
Cure: Replace the capacitor.
Remarks: There are probably other problems on the RF unit if this capacitor is bad. Check the voltages at D47 on the RF unit. Radio may have been struck by lightning or sustained a large RF overload through the antenna jack.

Symptom: No TX output in all modes. Problem is traced to no output at J8 on the RF unit.
Probable Cause: Bad Q14 amplifier on RF unit.
Cure: Replace Q14 (2SC2053). There may be other problems on the RF unit. Check the DC voltages at D47.

Symptom: The power to the radio flutters on and off when the TX power output is increased toward maximum. Inspection reveals that the internal power supply is unable to handle the current. Unit runs fine when the internal power supply is substituted with an external supply.
Probable Cause: Cracked solder in the current-sensing circuit of the power supply is shutting it down prematurely.
Cure: Resolder joints at the .0012 ohm resistor, R26 inside the power supply.
Remarks: This resistor appears as a metal bar soldered to the bottom PC board. Solder ONLY the edges of the bar before the holes at either end.

Symptom: Distorted/raspy-sounding TX in SSB modes. Average talk power is low, even at higher mic gain levels. CW, RTTY and FM seem normal.
Probable Cause: No base bias voltage at driver or PA transistors. Measure voltage at bases of driver and PA

transistors in TX SSB mode. Should be around .67 volts. O volts indicates trouble.
Cure: Bad Q6 (2SD880Y) on PA unit. If problem is intermittent, check for bad solder at the legs of Q6, or D2.

Symptom: Tuner won't tune on one or more bands.
Probable Cause: Presets are out of adjustment.
Cure: Adjust presets.

Symptom: Tuner can be tuned for 1:1 SWR in preset mode, but detunes when switched to the automatic mode.
Probable Cause: Bad relay on preset unit.
Cure: Replace relay RL1 (RZ-12) on preset unit.

Symptom: Tuner does not tune on any band. Inspection reveals that only one motor is turning.
Probable Cause: Bad motor driver transistors.
Cure: Check motor driver transistors Q1 & Q2, or Q3 & Q4 (depending on the motor that not turning) If the motor transistors overheated before they failed, also check related components for failure before replacing the bad motor driver transistors (or the new drivers will fail too).

Symptom: TX oscillations/spurious output, especially on lower bands at lower power levels.
Probable Causes: 1) Open parasitic-suppression resistor on PA unit. 2) Burned components on the ANT SW unit. 3) Bad drivers or finals.
Cure: Check the value of R22 (4.7 ohms) on PA unit. (This resistor may look OK but still be open.) Inspect the D4 area of the ANT SW unit and replace any burned components. If these solutions don't help, disconnect the cable at J10 on the RF unit and see if the problem goes away. If it does, then there is a problem with the TX/RX switching on the RF unit. If disconnecting J10 does not alleviate the problem, then most likely either the drivers or PA transistors are bad, especially if the ALC meter deflection is low.
Remarks: Spurious output may be cause by incorrect band switch voltage to the low-pass filter unit, or even faulty/burned components on the filter unit itself. The above causes should be ruled out first, however, since low-pass filter failures are uncommon in the IC-761.

Symptom: Radio seems to be stuck in "scan" mode.
Probable Cause: Bad IC2 on the logic unit.
Cure: Replace IC2 (RP5G01-007).

Symptom: Intermittent display. S-meter may peg and RX/TX may disappear when the unit is in the failure mode.
Probable Cause: Cracked solder beneath the DP-6 DC-DC

converter IC (IC1) on the display unit.
Cure: Carefully remove the DP-6 converter IC from the
display unit and resolder the pins of the IC to its circuit
board. Then reinstall the DP-6 back on the display unit.

Symptom: VFO tuning is erratic, sometimes skips frequencies
in a certain area of VFO knob travel. Least significant
digit in frequency display sometimes "flutters" back and
forth instead of changing incrementally when the VFO knob is
turned slowly.
Probable Cause: Bad rotary encoder.
Cure: Substitute rotary encoder with a known good one. It
is recommended that the rotary encoder be replaced as a
complete assembly if it is bad.
Remarks: If the unit tunes in only one direction, i.e.
either up or down, there may be a problem on the logic
unit.

Symptom: Loud, high pitched squeal emanates from inside
radio. May be intermittent.
Probable Cause: DC-DC converter transformer has a loose
core.
Cure: Replace DP-6 on the display unit.

Symptom: A whine eminates from inside radio in TX only at
certain power levels. Transmitter works OK.
Probable Cause: Loose core in DC-DC converter transformer
inside power supply.
Replace: T2 on reg. unit inside power supply.

From: wessel@via.nl
Message-ID: <4s90fd$sfo@news.via.nl>
Source record: 197917

Hello all,

A fellow HAM acquired this set recently. Modulation reports are extremely good and it is a beauty for the eye. But now he is looking for a manual and schematics. Does anyone know where to get these?

The KW2000E was made by KW Electronics LTD in Dartford, Great Brittain. As far as we know there were only about 2200 units made back around 1968 and the factory no longer exists.

Pointers, please?

Thanks for your time,

Bart, PA3GYU.

<Enormous snip>

I don't suppose anybody's done a similar exercise to this for the
Kenwood TH-79 have they ?

Is it possible to hook the TH-79 to a computer to upload memory
information for example ? - The radio does have a clone mode to upload
memory information from another TH-79.

From: mwolfe@interaccess.com
Message-ID: <4s9bfo$2ei@nntp.interaccess.com>
Source record: 197924

I am currently installing an Icom IC-706 in a Subaru Outback.

One of the sensors for the airbag system is under the console between the front seats. This is also where I will be running the DC power cable, speaker cable and remote head cable.

Does anyone know if this may possibly set off the airbag sensor or otherwise interfere with its proper operation? I really do not want to key up and have the airbag go off in my face. Subaru cannot tell me anything other than to not screw up existing wiring.

Thanks,
Mike.

Subject: Nickel Metal Hydride Batteries

L>Does anyone have experience with the new NMH batteries for hand held
>radios? Specifically, will my NiCd quick charger damage them?

I asked the same question and never got an answer from anyone in the
news group. I E-Mailed MAHA who sells them and they recommended slow
charging the packs if I had any doubts about using the ICOM charger that
I have. If that is the case, it is not very desirable since I am very
used to getting a full charge in less than 2 hours.

I would still like to know if they're better than the NI CADS.

Wire your car with a coil from a model T Ford, hide the cut off switch somewere it's insulated. It will not kill them but if they get around the door handels or other places on the body they have to grab the current will judt contract their mussels enough to make them grip and you got them and any one else who tries to help them get off. All you have to do is when you come back get the cops to take them away. I realy works I used it one time a when I came back, I had three kids hung on the car. It also works on dogs one time the guy up the street from me, allways let his two Afgan Hounds piss on my car in front of my house. one night I left it on and watched. When the dogs pissed on my car they bolted and took off, the guy couldn't hold them on the leash. From what I found out later on dog never came back home again and the other would never walk pass my car. You couldn't drag it.

678. 15V too much for mobile radio?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-13 00:00:00 UTC
From: adkinsg@piranha.ianet.net
Message-ID: <4s7cao$deo@piranha.ianet.net>
Source record: 197989
Cross-posted to: rec.radio.cb,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hi!

I recently found a 24VDC power supply in my garage that
came from an old monitor. I think I'm going to use it
to power a cheap little radio for base station use. (It's
a mobile radio, btw)

I'm thinking along the lines of using one of the TO-220 case
voltage regulator (maybe adding some big caps for ripple)
to bring the 24V down to 12 or 15 volts. My concern is that
12V may not be sufficient for full power transmit since the
radio expects 13.8. (The radio only pulls 1.5A at max
modulation, so it doesn't need a ton of juice)

There is a very common 15v regulator available, would that
be too far above the 13.8? I'm not aware of any 13.8v
parts.

Any help much appriciated!

>
>
>Then you need a cheap but reasonably accurate VHF meter, and there are
>several types much less expensive than the Bird and Coaxial Dynamics
>meters. You could borrow or buy a used Bird or Coaxial Dynamics meter.

Well, I said about the same thing earlier, but now I'm having second
thoughts. If the cheap meter's line section doesn't present a good match,
even the relative readings become questionable, and so does the SWR
calculated from them. In other words, we don't care much if the meter
shows us accurate power readings, but we do care that the relative
readings are in proportion. So the line section has to at least be
fully reciprocal.

This is a test you should perform on any meter. Take a forward and
reverse reading, then reverse the meter connections and take another
forward and reverse reading. If the first forward reading doesn't
match the second reverse reading, and the first reverse reading
doesn't match the second forward reading, the meter isn't reciprocal
and should be discarded.

Hand calibrated was the source of confusion.. I am used to "hand calibrated" and "hand plotted".

To me, hand calibrated means meters reach the end of a line and are placed by hand in a machine that supplies the correct current and/ or voltage. An operator pushes up - down buttons that operate a ramped and pulsed electro-magnetic source fixtured to de-magnetize or magnetize the field magnet until the meter reads the selected point. We called that hand-calibrated.

A good op could do a cheap 15% battery charger meter in about ten to 20 seconds. Direct labor cost was about 5 cents to build the entire meter, the bulk of which was calibration costs (in the early 80's).

Custom hand-plotted scales are much different. They were used on hundred dollar 1/2 percent (and better) mirrored lab type meters, mainly used as references for other meters.

>If I implied that the Hooke constant of the hairspring was non-linear,
>I didn't mean to. What I meant to imply was that the value of the
>Hooke constant for individual mass produced springs varies from unit
>to unit. That gives an offset to the reading over the entire range
>which isn't compensated by the zero adjustment, but not a non-linear
>error.

I thought you were implying Hooke's law didn't apply to hairspings, and they had uncontrolled rates in the area of use. Spring rate can shange without ill effect at all. All the movement requires is an adjustment in magnetic flux. Everything is right back to normal, on scale, and linear. As a matter of fact, one hairspring can be removed and all the meter will suffer is a lack of torque making balance more critical.

A change in spring rate only requires a change in pole flux, and everything is right back on track.

>That's impressive. Wish my Simpson 260 had a meter movement that good.
>It is specified as 3%.

Is that the movement alone, or does it include the associated components like multipliers and shunts? They certainly could do much better than that, since they competed with us in one and two percent meters! Unless they are using a Shurite movement, hi.

On some less expensive meters we bought movements from Korea (uncalibrated, unbalanced, no pointers)...they were about three dollars each and could easily maintain 2% tolerence.

Our own tooling allowed movements with much tighter control of flux window errors, providing much better scale tracking from batch to batch.

Analog meters aren't as bad as they are sometimes made them out to be, the biggest problem is perhaps less and less people know how to read them. I know that sounds funny, but I've seen new age "technicians" that can't even read a watch (thank you FCC and de-regulation)! A lot of the stuff is cheap junk, and some is pretty darn good. Bird bought very good 1% movements ten years ago, I suspect they still do since the overall meter has the same spec. The temperature tolerance isn't well known, but it is (or at least was) a true fact.

But we are digressing from the question, and I think we agree that the best route is a Bird, or another know quality meter. Anything that puts a bump in the line is almost useless.

Slick. I didn't know that was how it was done.

>Custom hand-plotted scales are much different. They were used on hundred
>dollar 1/2 percent (and better) mirrored lab type meters, mainly used as

Yeah, that's what I thought was needed for a "hand calibrated" meter.

>>That's impressive. Wish my Simpson 260 had a meter movement that good.
>>It is specified as 3%.

>they are using a Shurite movement, hi.

It has 3% printed on its face. I don't know if that's the movement
tolerance or the instrument tolerance. I assumed it to be the meter
movement tolerance since it is printed on the meter scale, perhaps
not.

>Analog meters aren't as bad as they are sometimes made them out to be, the

I don't think you can blame that on the FCC or de-regulation, just a technological change. Who today can use a slide rule (except us old timers)? That skill has been obsoleted by the programable calculator and the computer. The DMM has had a similar effect for meters. As to watches, I recently went back to a "hand" watch after wearing a digital unit for years, and it was a real culture shock. Some of my colleagues even made fun of me for being so retro.

>A lot of the stuff is
>cheap junk, and some is pretty darn good. Bird bought very good 1%

That temperature tolerance has me interested. I'm going to have to instrument the slugs on the power measuring system I described in the previous note and see what effects there are when I do a power run on the transmitter.

>But we are digressing from the question, and I think we agree that the
>best route is a Bird, or another know quality meter. Anything that puts a
>bump in the line is almost useless.

Yes, I agree totally. An incorrect measurement is worse than no measurement at all. It is guaranteed to be wrong while just hoping the power level is right at least has a chance of being correct. :-) That's like the old saying that a stopped clock is right twice a day in reverse. (Hmmm, that probably doesn't make any sense to digital clock users unless their stopped clocks flash 12:00.)

You can raise the voltage of the common 12 volt three terminal regulators (7812, LM340, etc) by putting diodes in series with the common terminal to chassis (note that you have to use an insulated mounting for the tab, IE a mica washer). 3 diodes will increase the voltage by 1.8 volts (0.6 volts per diode drop).

Note that the regulator will have to drop 10.2 volts to get from 24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it very well. A TO-3 cased regulator might be a better choice (again use a mounting kit, you can't ground the case). The added diodes need to be rated for the current as well.

Hmm, let's see. 24 VDC on the source, 1.5 amps, and 15 vdc out, and a to-220 case egh? I'd start saving for a nice service manual on that radio if i were you. When that regulator blows from the 14 watts you attempted to dissipate it may fail shorted and put 24 volts into your mobile. Either that or plan on some pretty fancy cooling system for that puppy, it's going to get screaming warm.

Take a look at the junction to case thermal resistance of the regulator you are planning on using and do a few simple calculations before you put this thing together.

>reccomend me a good setup? Thank you!

HTs are low power, have poor antennas, and suffer from receiver overload
if used with better antennas. They also usually have low audio output,
and become clumsy to use when wired to external power, external antennas,
and external amplifiers and filters. Unless you plan to operate foot mobile
most of the time, a regular mobile rig is better. With a quick release
mount, you can move that from the car to the house easily, and it will
have plenty of power, good audio output, and if you select carefully,
a good receiver tolerant of strong out of band signals.

The latter should be your primary criteria when selecting a rig. If
it has a reputation for IMD, steer away from it. One 2m HT has a good
reputation for dealing with out of band signals. That's the Radio
Shack (yes, Radio Shack) HTX-202. Most other amateur HTs are horrible
when used on an external antenna. However, among grown up mobile rigs,
the RS HTX-212 (mobile rig) sucks in this department, and I can't
recomend it.

The trend toward DC to light frequency coverage in current amateur
rigs has caused many of them to suffer severely from IMD. Icom has
gotten a particularly bad reputation for some of its recent rigs,
though some of its older rigs were excellent. Yaesu and Standard
have some new rigs that are supposed to be very good. I'd avoid
Kenwood rigs because of other problems (mostly thermal). Alinco
has some cost effective models, but IMD resistance is only so-so.

If you are on a tight budget, don't overlook surplus land mobile
radios. The GE Mastr II and Motorola Micor are very very good,
and can be found for $50. You have to spring for some crystals,
however, and they don't have many bells and whistles, but they
are excellent *2-way radios*, not scanners, and are rugged enough
to survive almost anything. With 80 to 110 watts output, they'll
also be *heard* in places where the handi-scratchie will make
other repeater users pull their hair in frustration from having
to try to listen to you.

Garry,

The LM338K variable voltage regulator (5A) should be OK for this
purpose; two resistors set the voltage for you. I use these to make
13.8v gel battery chargers and they work fine. BTW I float 12v batteries
across all my 13.8v supplies as a protection against regulator failure.
Makes a great UPS too! Don't forget the reverse connected diode across
the top of the regulator if you use it for battery charging - if the
device gets volts on its o/p with none on its i/p, like when the mains
fails, it blows. If you'd like the circuit I use, I'll snailmail it to
you.

Include a dropping resistor between the supply and the regulator to
minimize the voltage drop (and subsequent power dissipation) across the
regulator.

Maxim makes an IC, the MAX2003A, which is a switch/linear mode charge controller for NiCad and NiMh cells (all strap selectable). It definately DOES support a quick-charge mode for the NiMh cells (you need to use a thermistor to let the chip detect temperature), but for all of the other reasons given (self-discharge, etc.) I would end to stick with NiCads as the incremental capacity of NiMh isn't worth of the drawbacks to me in radio applications.

Hi there Gary. Thanks very much for your reccomendations. I suppose
hand held isn't the way to go. Thats what I was afraid of. Its ok though.
Alright, so I am going to go with a reagular 'home' setup. What equipment do
you think I should I get (i.e transciever etc), and also what are the prices?
I am not necissarily on a tight budget, but around 300 (us) would be great! I
am learning alot about equipment, but the funniest thing is, it doesn't really
explain 'equipment' in detail. I know I need a transciever and reciever etc,
but all the others I am not too sure about. Also, I will probably need an
antenna. One thing I am not to keen about is putting it on the roof. Is there
any way I could just put it in the window or something similiar where it
doesn't have to be screwed in or permanently mounted on something?
Thank so much for your help. I really appreciate it!

mikanton@ix.netcom.com

695. ADMS 1C

Has anyone out there looked at the RDF files produced by the ADMS-1c to determine the format of the data. What would be great is a utility that could take the RDF file, translate it into something that Excel could read and modify, then be able to translate the Excel file back to RDF format. While at present time the ADMS software is the only choice for those who want to computer program their radios, it is weak when wanting to view or edit the memory locations.

Paul

Through my experience, I would say your fine either way... 12V and 13.8V have pretty much become interchangable without a problem. and if you have a tolerance of 1.8V, and there is no problem, then 15V should be no problem as well, after all, it's less of a difference than 12 and 13.8... As long as you're in the ballpark you should be ok. Just don't attempt 24V. :)

SWR is affected by the antenna not by the radio. In order to really
determine the cause try a true 50ohm dummy load. I have also seen
cases where the amp output filter is set too narrow and can cause
adverse conditions as well.

I would not suggest going much over 14 volts on a mobile rig. When I was 9X5PT,
I tried floating a charger on a car type battery to feed a FT101 (rated 13.8V, 20A)
My homebrew charger was RF sentitive, and was charging full blast all the time I
was transmitting. Both switching transistors failed, and I had to cut them out of
the circuit to get back on 220 V power. VE3BOZ had to ship me spares from
Canada.... Small print in the manual quoted a 14 volt MAXIMUM input voltage for
the rig. So I would get a BIG 15 volt zener and float it on that output, and use a
fast acting fuse in series, as well. If your supply has 220-110 volt input, you
could feed it 120 volt and switch it to 220 volt mode, also. Or else remove filter
capacitors etc. to get it to lower voltage output.

Just a word of caution to anyone who may get this idea.. Although it is a
GREAT concept, it is illegal at least in the State of Texas. I am all
for it, but not for the jail time I may have to do. I am a police
officer here in Dallas and have seen someone at one time attatch 220 to
the door knob of their dope house.. I am not sure exactly how it worked,
but the doper shocked himself in the process.. oh well.

Hello Garry:

Yes I would vote that 15 volts is a bit high for your radio.

There are voltage regulators that are adjustable in a TO-3 and TO-220 case, the TO-3 being preferable. I think the part number is LM323, its a 1.5 amp voltage regulator that can have its output voltage easly adjusted by a inexpensive 5K pot. Radio Shack has a short book on voltage regulators. And with 24 volts available it should had auto work. If you follow the pin out wiring corectley.

Or a regulated 12 volt power supply all ready assembled would save a lot of time, Radio Shack also has a low current unit available.

Hope you get ot all working.

Jay.

I adjusted R126 in the 706 to improve the blanking. I have an Aerostar van, and on hf, noise is almost no problem. On six meters it is more so, runs s3-s4 on the 706 meter. Nb almost completely eliminates this. On two meters, ssb/cw, with a 5/8 vertical ant, (I know, I know) noise is about S5 and the blanker maybe reduced it to S3. I increased R126 so it pretty much doesn't show on the meter and I have had no trouble with lessened cross mod. However, I use this rig mobile only, and don't encounter too many 40+ plus over 9 sigs.

As an aside, the above comments are based on Hustler hf ants with only 18" of mast plus a spring below the resonator. On 50 MHz, I initially used a 1/4 wave vertical, and ignition noise was much worse with it. I now have a M2 Sqloop and when I can keep it tuned where I want it, all is OK. I hope that when I get a 2 meter horizontal antenna on the car, ig noise will be similarly reduced compared with the 5/8 vertical.

While on the 706, has anyone else noted that after performing the yellow wire mod, plus tying it to the VCO switching, the intermod immunity is worse on two meters?

Also, for one of the lucky who was able to get a service manual before ICOM ran out, does it look like the existing ssb filter, which appears to be the same size as the plug in optional filters, have the same pin arrangement so that maybe the optional 1.9 KHz ssb filter might be installed in its place?

Thanks.

Bill, N9HH

I think the TH79 clones from a radios transmit to another radios
receive rather than thru a hard wire connection like the FT50.
So I would guess an interface is not available.
If you were able to read the dtmf tone coding sequence for cloning the
radio, generate them on a computer & send it to the receiving radio
you could acheive results, but what a project!

Most of the other posters have suggested various ways to use a linear
regulator to produce the 13,8 volts you want. National Semiconductor
makes a very simple *switching* regulator called the LM2576. These
parts come in 3,3v., 5,0v., 12,0v., 15,0v., and adjustable versions.
You woule want either the LM2576-12 (fixed 12v version) or the
LM2576-ADJ (adjustable adjustable). They come in a TO-220 package,
and are almost as easy to use as a 3-terminal linear regulator and run
a heck of a lot cooler. They produce a positive output, and the
heatsink tab is ground. The data sheet includes full application
information, including where to get the inductors (3 suppliers).

I just pickuped a TEN-TEC Paragon at the Indy ham fest yousterday. This is realy my first HF radio, I have an old Heath Kit HW-100, I was never able to do more that tune up an antenna on it. Anyway, I have all the options on it except the .25 kHz filter and the RS232 board. My question is about software for the radio. I wanted to know if there was anyone who used software for this radio to control it, what they thought of it and where I can get some... I will most likely put this option in the radio if it helps any... Thanks.

>have been told by the experts that absolute accuracy is not worth
>seeking and in publications like the ARRL "Reflections" we have a
>full and convincing justification for this. I much prefer an
>instrument like the MFJ 259 which has helped me more with antenna
>work than anything other than a Smith Chart in 40 years of hamming.

Ah, Reflections doesn't say accurate measurements aren't worth
seeking. What it says is that a high SWR may not be a bad thing.
And that's a different matter entirely. How do you use a Smith
Chart if you don't know which SWR circle to follow around it?

Of course we have to use good sense in determining the level
of accuracy which is *necessary* for our work. We often don't
need three decimal places. But we do like to have *some* assurance
that we're at least in the right ballpark, and that our instruments
aren't leading us down the garden path with faulty readings.

A HT isn't *always* a bad way to go. It is a specialist tool, designed for foot mobile operation, but in some cases it can serve satisfactorily for other uses as well. Unless there are several close repeaters, and few high power pager transmitters where you'll operate, however, it probably isn't your best choice.

Well, a transceiver *is* a receiver and transmitter combined into one package. That's what most people buy today. Most of the available radios are really designed for mobile, not home, use, and are designed to operate off of 12 VDC. There are a few home rigs that operate off of AC, but they are usually the more expensive multimode rigs which do SSB and CW as well as FM. You will likely want to buy just the 2m FM rig, so you'll also need a power supply to use it in the house. Astron makes good ones. They're what I use. Most of the rigs will be happy with a 20 ampere model, but a 35 amp model does offer some reserve to handle other station accessories. Don't scrimp here, an underrated power supply can ruin an otherwise good station.

About VHF/UHF antennas, the most important thing is height. The higher you can get your antenna, the greater the range you will have. Now this height is height above average terrain. If you live on a mountaintop, then you don't need a tall tower. But if you live in a hole, you'd better be buying stock in Rohn Towers. In any event, you'd like to have your antenna up above local ground clutter. If you put it down inside the house, some of your signal is going to be absorbed by the house, trees in the yard, neighbor's houses, and most importantly by *you*.

There is a definite biohazard to being in the near field of a moderately powerful VHF/UHF station's antenna. A vertical puts most of its radiation out toward the horizon, not straight down, so if you can get it *above* you,

you won't be exposed to strong fields. That's a reason to mount mobile antennas on the car roof too.

Don't cut corners on your feedline either. Good feedline pays dividends two ways. First it doesn't attenuate signals you are trying to hear, so you can hear weaker or more distant stations. And second it doesn't attenuate signals you are trying to transmit. It's expensive to generate RF, you don't want to throw any more of it away than you can help in a lossy feedline. Don't try to save a few cents a foot, that makes no sense when you just spent hundreds of dollars on a radio to generate the RF. The same goes for the antenna, don't cut corners, get a good one, mount it high, and you won't regret it.

I'm not going to get into particular radio model numbers here. There are plenty of good choices out there, and part of the fun is in deciding which one you want. QST does good reviews of these radios. Browse through back issues and read up on the different radios available. It's fun, like a kid looking through a Christmas catalog, and you'll learn a bit more about what's out there in the process.

728. FTT-12 keypad for FT50, need info and perhaps WTB

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-14 00:00:00 UTC
From: knappsm@cin.net
Message-ID: <4sa4ee$69q@news.cin.net>
Source record: 197939
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

Hello,

I heard that some others on one of these groups were having problems with their FT50's and the optional FTT-12 keypad. My ISP's news spool did not have the articles on it so I'm posting looking for the info.

What's the scoop with this keypad? What's wrong, what's right?

I'm mostly intrested in PL/CTCSS decode (I can't believe an otherwise great (IMHO) radio lacks this feature). The recorder functions are not as important, although I do miss the ability to record the last received signal (up to 20sec?), which my FT40 would do.

If you do have an FTT-12 and are unhappy with it and want to sell it, let me know. Assuming there are no MAJOR flaws and the above two features work...I might be intrested in buying it from you!

Thanks for your help!

>NO signal may be transmitted by an amateur station BEFORE a control op
>screens the call off the air. This includes RINGING, beeps, or any other
>signal designed to get the amateurs attention....EVEN a carrier being
>transmitted with NO tone, etc is in violation...

So, no autopatch is legal then because no control op screens *any*
autopatch call before it is on the air and heard at the control
point. (That's why it's called *auto*patching.) Nonsense. Prose
Walker is retired. That kind of silly interpretation by the FCC
is gone.

Besides the telemetry indicating there is a phone ringing at the
repeater site has been screened by a control operator, the automatic
control operator running the repeater. And telemetry *is* allowed
under automatic control.

Hello,

The magazine you might be referring to is called "Radio and
Communications". If you're trying to get hold of an article, or subcribe
to the mag, they give the following address in an early 96 issue.

"Radio and Communications,
GPO Box 5252,
Sydney, NSW, 2001
AUSTRALIA "

Phone No 61 2 2600075, Fax 61 2 2674363.

Production Editor can be contacted by E-mail at vk3ce@tbsa.com.au

Hope this is of some help.

733. Radio Shack 2m HT amp

From: afn35036@afn.org
Message-ID: <31e80449.468015@usenet.afn.org>
Source record: 197944

Since RS has their 2m HT amp on sale this month and I haven't seen anyone post this question so far, I figure I'd better do it before the sale ends.

Does anyone have any comments, good or bad, about the RS 2m HT amp? When it first came out, I did hear a few good things about it but haven't heard anything lately. Compared to the Tucker and MFJ versions, is this a good product? Can the preamp be turned off for use in urban areas? Is the power connector of a standard design so that extra power cables can be made?

Thanks

Steve

Well, if you're programming the Yaesu FT-51R, then you can already do exactly that with EZ Clone. EZ Clone saves its radio information in a tab-separated, plain ASCII file. That file can be sucked into a spreadsheet or whatever, edited, then sent back to EZ Clone for downloading to the radio.

This is one of the reasons why EZ Clone all along has saved its radio information in plain ASCII format.

Congratulations Rick!

Now, I'm seeing more and more Boatanchor gear being advertised on rec.radio.swap than ever before. I appeal to those of you who have such a piece of gear stored in the garage or attic *not* to toss it out thinking it's worthless by today's standards and no one would possibly want it. Someone somewhere *will* want it and will put it on the air.

One of the greatest features of BA radios is the ease of repairing them and bringing them back to life; the components are large and can been seen without a microscope (unlike today's state-of-the-art radios). A needed tube can almost always be found by posting a WTB ad on .swap, or checking the tube retailers advertised in the magazines. The lifespan of a tube can range from 5 years to 25 years; treat them with care and they'll burn for years. Note that tubes are still being manufactured outside The U.S.

Millions of these radios were manufactured over the decades; now discussions regarding them and those who love them will finally have a home (if you vote YES during the Call For Votes) on rec.radio.amateur.boatanchors.

REQUEST FOR DISCUSSION (RFD)
unmoderated group rec.radio.amateur.boatanchors

Newsgroup line:
rec.radio.amateur.boatanchors Collecting classic amateur and military radios.

This is a formal Request For Discussion (RFD) for the creation of a
world-wide unmoderated Usenet newsgroup rec.radio.amateur.boatanchors.
This is not a Call for Votes (CFV); you cannot vote at this time.
Procedural details are below.

RATIONALE: rec.radio.amateur.boatanchors

The term "Boatanchors" refers to older (usually more than 25 years old)
radios used by amateur radio operators. Boatanchors apparently was
derived from a term meaning an item that was no longer useful and
its primary function being that it could be used to hold a boat from
drifting. Today, the term is universally understood by hams to mean
radios that have a nostalgic value to collectors. Thousands of hams
got started with their hobby using these grand old radios of the 50's
and 60's. They may have built them from kits, or converted discarded
military surplus equipment. Hams who have an interest in this fine
old equipment have adopted the term boatanchors to describe it
lovingly.

Within the amateur radio service a number of terms are used which are
unfamiliar to those outside of the hobby. This is not unlike other
special interest groups. Within amateur radio, long distance contacts
are referred to as DX, low power operating is QRP, confirmation
cards are QSL cards. No other terms could possibly be used by hams
in these cases to define the item. In the same manner, boatanchors
has come into meaning and is now universally understood.

There is increasing interest in boatanchors by hams. There is a
mailing list that has been in existence for several years called
the boatanchors list. It has had as many as 1000 interested users.
This confirms not only the size of the interest in boatanchors
but the acceptance of the term. The proposed newsgroup is not
intended to replace the mailing list but rather to augment it by
providing a Usenet forum for similar discussions. Many people, for a
variety of reasons would rather use netnews rather than a mailing list
for discussions.

Currently discussions involving boatanchors are held in rec.radio.misc
and swap offers are in rec.radio.swap. The volume of traffic in both

newsgroups has grown significantly recently such that boatanchor discussions are most appropriately held in a separate newsgroup. Swap activity is currently in rec.radio.swap but due to the specialized nature of boatanchor swapping it often requires significant discussion instead of merely simple listing of items for sale and such discussions are not permitted in the charter of rec.radio.swap. In addition, rec.radio.swap is for all types of radios and the volume there has been so great recently that a separate newsgroup specifically for boatanchors is required.

An extensive discussion took place during April and May 1996 in news.groups regarding the suitability of the term boatanchors as a newsgroup name. Opinions are divided on the issue. This proponent believes that the term is acceptable, and since it is within the rec.radio.amateur hierarchy it is not going to result in confusion to non-readers of the newsgroup. Therefore, this formal RFD proposes the new newsgroup and invites discussion, pro and con. The RFD, CFV, and voting process are designed to settle such issues, and we are fortunate to have such a process in place.

CHARTER: rec.radio.amateur.boatanchors

This newsgroup is for discussions of classic amateur radio gear manufactured more than 25 years ago. Equipment of this category includes transmitters, receivers, and station accessories. Military equipment modified for use by amateurs is also appropriate for discussion in this newsgroup. Topics regarding equipment built entirely or primarily with vacuum tubes (as opposed to solid state) are welcomed in this newsgroup. Suitable topics may include collecting, modifying, tuning, obtaining parts, values of classic gear, sources for parts, questions and advice for others, and offers to buy or sell. Swapping is not a major part of the newsgroup but is permitted.

END CHARTER.

PROCEDURE:

This is a request for discussion, not a call for votes. In this phase of the process, any potential problems with the proposed newsgroup should be raised and resolved. The discussion period will continue for a minimum of 21 days (starting from when the first RFD for this proposal is posted to news.announce.newgroups), after which a Call For Votes (CFV) may be posted by a neutral vote taker if the discussion warrants it. Please do not attempt to vote until this happens.

All discussion of this proposal should be posted to news.groups.

This RFD attempts to comply fully with the Usenet newsgroup creation guidelines outlined in "How to Create a New Usenet Newsgroup" and "How to Format and Submit a New Group Proposal". Please refer to these documents (available in news.announce.newgroups) if you have any questions about the process.

DISTRIBUTION:

This RFD has been posted to the following newsgroups:

news.announce.newgroups, news.groups,
rec.radio.swap, rec.radio.amateur.misc

Source record: 197959

Hi,

Just talked to a ham buddy in JA this past weekend. He
passed along some interesting news for those Alinco DX70 owners
out here.

Alinco is now selling a new rig in JA, the DX70G, which offers
100 watts on 6 meters instead of only 10 watts on 6. Same
basic chassis as the DX70, but with a different PA. It
didnt sound like the rig was intended for export, but,
he also mentioned something about the PA units being available
for those that have the DX70 with 10 watts on 6.

Interesting. Will keep everyone posted as more info is
available.

I've heard both the 706 and TS50 have lousy noise blankers.
This seems critical for a mobile HF rig. What about other
HF mobiles? Are there any out there that DO have good noise blankers?

DX-70?

FT900CAT?

TS130?

others?

750. Re: DCI-100 DVR Board

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-14 00:00:00 UTC
From: Bob Krueger <atec@gglbbs.com>
Message-ID: <31E9107A.61CF@gglbbs.com>
Source record: 197961

I own a Digital Communications DCI-100 digital voice recorder board. The digital format that DCI uses for recording files does not follow any industry standard such as VOC, WAVE, etc., their digital format also terminates the recording with a unique end of file marker.

The down side of their system is that you have to do all your recording of files over the air, this is both cumbersome and does not allow much flexibility to be creative when constructing tail messages, id's, bulletins and etc..

When recording system files one has to disable the repeater, even then you must still transmit on the input to record new system files. This is the one and only BIG short fall of the device, other than that it performs well.

I have had many discussions with Ralph Olds over several years at DCI about providing a voice file editor to record and edit system files off the air, nothing has ever come out of those discussions and there doesn't seem to be much interest on his part in developing a voice file editor for his DVR, I have also discussed several other possibilities such as a WAV and VOC file converter/editor that would allow one to create files with other voice boards and then convert them to his digital format, nothing has come of this either.

I would like to hear from other DCI-100 owners on this subject, especially from anyone who has developed such an editor/converter or knows of a source for one, perhaps we can get a dialog going between owners of the DCI-100 and possibly as a group press DCI to develope one themselves, there's strength in numbers.

The DCI-100 will play a WAV file, however, without the specific end of file marker, they DVR will hang your system in transmit, maybe someone out there has figured a way around this problem, would like to hear from them also.

According to the technical information provided in Radio/Tech Modifications & Alignment Controls, Ed. 8A, by ArtSci...

"...the electronic circuits (78A) can only tune a 20-30 MHz window around the original center frequency, which was tuned at the factory, and better performance will be obtained a the top or bottom ends of the tuneable range."

If you'd like to get a copy of their book.. their phone number is: 818-843-4080.

Well, I recently set up a "PUBLIC" autopatch system in the Mercer County area and as far as regulations are concerned, everything is completely legit. I DO have reverse patch enabled since alot of my time is spent in the mobile. I put up the autopatch to allow local hams an alternative patch instead of going through the local club repeater, which is quite busy. Also in case of a crisis, this allows the use of the repeater for emergency communications and the patch allows for emergency telephone communications. The only drawback is, it's simplex, so both parties need to wait for the turnaround beeps and some recipients of calls just can't get the hang of that. But, for all intent, it works fairly well. I really like the system the club is using as described in the preceeding article (Using digitized and recorded voice to announce the call) that is a very nice system. I don't know what an AX25 is (What is it?) But anyways, as long as the system ID's itself before, and after, a transmission ... it is completely legal. Only transmissions without identity are considered infractions on the FCC's regulations.

Hello and thanks for reading this.

Icom AG-25 Mast-mount Pre-amp for sale. Used only three months

(working the birds is TOO expensive).

Complete with original box, docs, and purchase receipt.

Sells new for $159. Price is $99 plus shipping.

Please call Tim Murray KC4YDJ at (317) 984-2005 or e-mail
tamurray@iquest.net

Thanks es 73.

757. Problems with CT-17, several Icoms ? ?

From: Tim Murray <tamurray@iquest.net>
Message-ID: <DuKDF9.Ipv@iquest.net>
Source record: 197819

Hello and thanks for reading this. I am having problems with my CT-17 C-IV interface and a 7100, 275, 575, and R72.

I tune one radio, and it tunes the 7100.

I have yet to find a rig control program that will work with the 7100. It downloads crap, instead of the proper freqs that are in memory. It does manually enter a frequncy into the rig, but will not scan, even when I enter the freqs into the database.

My log program does auto-tune with the 10 meter rig (575) so I know the com port is configure properly.

Anyone have any ideas? PLEASE e-mail Tim KC4YDJ at tamurray@iquest.net with any suggestions. Many thanks in advance es 73.....

>Yes I would vote that 15 volts is a bit high for your radio.

Hi!

I ran some tests this afternoon with my DMM. I connected the DMM
to a lighter plug and then drove around and watched the voltage.

Here's what I saw:

Started out at 12.8v before starting the car

Started the car, and it jumped to 14.8 for several seconds then
settled down to 14.6 for about 2 minutes.

As I drove over the next 10 minutes, it slowly creeped down
to 14.2 where it stayed. (at least until I quit watching
the meter and started watching the road!)

FWIW, the car is a 92 Explorer.

:
:mikanton@ix.netcom.com

I started with an HT- I think this is a good starting point for most- an HT isnt the most powerful thing around, but it is the most versatile, especially if there are several repeaters you can hit in your locality. The cost being a factor here I would stick with an HT- 2M or 440, depending upon which is used more in your area (Usually 2 is, but in my immediate area, there are more 440 machines.) You may want to try getting your hands on a used/new FT-530 or an Alinco DJ-580/582. Both are very good dual band HTs. Or, if you just want 2 meters, radio shack's talkie isnt "that bad" meaning it has good overall quality, but doesnt have some of the bells and whistles of the other rigs. However, its price point is appealing. Used units of this rig go for about $100.

>immunity is worse on two meters?

No. And it shouldn't be, the same 2m bandpass filter is still used
inside the 2m band. There is no electrical change when operating
2m. The only effect of the yellow wire mod is to change the filter
used when tuning *outside* the 2m band.

>Also, for one of the lucky who was able to get a service manual

No, they hosed us, the pins are oriented differently. You could
make a little adapter board to make it work, but the filters aren't
just drop in replacements for each other.

>the 100 watt slug and pin the meter when doing your transmitter alignment or
>instead use the 250 watt slug and deal with less than half scale meter
>deflection?

Yeah, but an 80 watt Mitrek would have that problem with your meter.
The breaks had to go somewhere. Having to buy a bunch of slugs is a
pain, but OTOH the Bird 43 is so rugged that I don't mind banging it
around on the tower. Most other meters are a bit on the wimpy side for
rough use in the field (or too bulky and heavy). And when you're doing
precision work, it is handy to be able to just move the slug from one
meter to another rather than cabling and uncabling a single meter to
read power in and out of a device. (By using the same slug in both
meters, I know that the ratios are likely to be more nearly correct
than if I were to depend on two different sensors.)

There's nothing wrong with preferring a different manufacturer's meter
over the Bird. But I like them, and they have become an industry standard.
I've also got the Coaxial Dynamics clone, but it's bigger and clumsier
to use in the field (nice mirrored movement though).

I also like Dielectric's loads, but the Bird loads are Ok too.

765. FS MUST SELL ASAP: 900 HT, Johnson VHF 60 Watt, Yaesu FT40

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-15 00:00:00 UTC
From: eplatt@wco.com
Message-ID: <31ea5c14.3877281@news.wco.com>
Source record: 197827

Must Sell ASAP: (No reasonable offer refused):
(1) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 1 brand new battery (date coded by Uniden 9602, aka 02-96, has been used twice), one older battery (~89 but still works great!), a SMC antenna (standard Uniden Mount), a gain BNC antenna (has BNC-SMC converter), a mag mount mobile antenna, rapid charger (not available anymore, hard to come by!!!) and a vinyl holster (no belt loop, just more for shipping/travel. $375/bo. Invested much more into it. Repeater closed down. no more use

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

I _MIGHT_ have a Yaesu FT-40 99 channel 70cm Ham rig up for sale soon, depending if I like it I keep it, if not, I sell it. Brand new, digital voice (can record 20 seconds of audio from radio and play back through speaker or back on air (record your call! never say it again!) Great radio. Would need $400/bo. If interested, contact me, and let me know, I'll put you first on list if I sell (would be in ~20 days.)

ALL PRICES NEGOT.! I need to sell, so give me an offer!

eplatt@wco.com, or call me anytime at 415-939-1037.

A cell phone (or other mobile phone service) is more often the "good" and appropriate option, even if it costs more. Ham radio is not intended to be a replacement for common carrier mobile phone services. Patches are useful tools but they should not be used to avoid using (and paying for) a real mobile phone service.

From: 73573.1504@compuserve.com
Message-ID: <4se28e$4lf@nntpa.cb.lucent.com>
Source record: 197832

I been working on deciphering the RDF file format for the FT-50. I by no means have it entirely figured out, but I have figured some things out. The file is in binary format, but some of the comments and alphas for the channels are in ASCII.

File Address Purpose Format

00B4 - 05DB Divisors for channel freq 3 bytes/channel
first byte for Rx
2nd byte for Tx
3rd byte unknown

0600 - 0CDF Display info for Memory 16 bytes/channel
channels last 4 bytes binary frequency display info

13FA - 161F Alphas for memory 5 bytes/channel ASCII
channels

1620 - 23D0 Comments for memory 20 bytes/channel ASCII
channels

The toggles on the main screen seem to change the bits in addresses 138E and 138F, except for extended receive which seems to change addresses 0CE8 and 0CE9. Many of the other options on the main screen seem to change the bytes in the 0E23 - 0E29 range.

This is an ongoing project that I started when I realized that the FT-50 had capabilities that were not documented. I am still trying to figure the rest of the file format, so that I can activate exactly the capabilities that I want without changing the entire personality of the radio.

If anyone has more more info on the file format, I would apprecaite any help.

>1. What equipment is generally considered best and why? (Also studying for
>my Tech. License.) ...

Best for what? There are a lot of niches, and different radios fill
them best. For example, I have a Standard C508A HT, but if I needed
a more powerful HT I'd look at the Yaesu FT50R, or if I needed
simultaneous dual receive I'd look at the FT51R. But what I wanted
was very small size and very long battery life, so I bought the
Standard. If I were looking for a new dualband mobile rig, I'd look
at the Standard 7518 or the Yaesu FT-8000. If I wanted a satellite
rig (and money were no object) then I'd consider an Icom IC-970, or
the Icom IC-275 and IC-475 pair (wonderful radios). If money meant
something, I'd choose the FT-736R (and indeed that's what I have).
I would *not* buy the Kenwood TS-790A (actually I did, and it sucked,
like every other Kenwood I've been suckered into buying).

>2. Best (?stepless) scanner?

Scanners have steps (channels). That's how they can scan quickly.
However, there is a near field receiver which is stepless, made
by Opto. I am not in the spy-counterspy business, though, so I
feel no need for such a thing. I do have a BC-780XLT that I've
modified to be a test instrument, and there's an old Radio Shack
scanner laying around here somewhere. I prefer to use my Tek
spectrum analyzer or my IFR service monitor for snooping outside
the ham bands. (I don't do much of that unless I'm looking for
a spur.)

>than a NiCad. I'd appreciate any feedback - especially regarding MAHA.

True NiCd memory is an extremely rare thing, so rare in fact that I'd
wager no amateur has ever seen it in his equipment. NiCd memory can
only occur under certain extremely specialized conditions, and no amateur
gear ever produces those conditions. What most amateurs mistakenly call
memory is a result of *overcharging* NiCds. This can create voltage
depression, which isn't memory, but lots of amateurs call it that.
It's easy to avoid, however, just don't overcharge your batteries.

NiMH batteries have more capacity per kilogram than NiCds, but they
also have a much higher self-discharge characteristic, so it is use
it or lose it. And they have fewer charge-discharge cycles before they
fail. In typical use, a NiMH battery will fail within 2 years, most
NiCd batteries will last 5 or more years (assuming both types are
treated properly, abusive use will kill either type quickly).

>I know of several hams who have sought Birds believing that the
>situation demands it.

Indeed. I'm often amused to read someone saying that they've tuned
their antenna for a low VSWR so it must be working well. I often
remark in return that a good dummy load has a perfect 1:1 VSWR,
and has a very flat VSWR curve, but it doesn't get out at all.
A flat VSWR curve is almost always a tipoff that the antenna
system is very inefficient. Often it means there's so much
feedline loss that the true VSWR curve of the antenna is masked.

(That's not to say that one should adjust an antenna for a
high VSWR in order for it to work well. That's just another
case of blindly striving for a number.)

SWR measuring instruments are useful tools, but people should
think a bit more about what the readings they get actually
imply about their antenna systems rather than just striving
for some arbitrary value.

>the Alinco separation cable and bracket do not appear to support quick
>release.

You are correct. The Alinco brackets do not allow quick release. The bracket for the control panel attaches to the back surface of the panel with small Phillips-head machine screws.

>Please correct me if this assumption is incorrect. As a real ham (read:
>cheapskate), I don't want to pay for the separation kit when all I really
>need is the connectors. Does anyone know of a source for the tiny connector
>s that are used?

It would not be wise to be connecting and disconnecting these tiny little connectors very much. The pins are small, the connectors are fragile, and I would worry about breaking them. The strain reliefs Alinco supplies with the separation cable kit are a MUST. Also, I spoke with a technician at Alinco about extending the existing cable or making my own, and he highly discouraged it. They designed the rig to drive only the short amount of cable supplied in the kit, and anything longer or of a different type may cause the rig not to function properly. Although, I have heard someone on one of the newsgroups saying they successfully extended the Alinco cable to about 150% of its original length.

>If the Alinco bracket and cable can be quickly removed I won't
>bother building one. Does anyone know?

Sorry, no such luck. You could try to build something, but again, I'd recommend not doing so to prevent damage to the tiny connectors.

I really doubt that thieves would mess with the control head, especially if it's down out of the way and not real visible. It's obviously not for a CB radio, and thieves "generally" tend to stay away from unknown types of radio equipment that might be hard to pawn or sell. I'd be far more concerned with thieves stealing the stereo out of your dash.

I just checked out the EZ clone web site, http://www.acsys.com and was interested in their product for programming my Yaesu ft50r. The feature that looked interesting is that the interface connects to the internet allowing users to download frequecy file lists from around the country. I am wondering if anybody out there has used their software and would like to hear experiences. The site says it is beta testing, so I would like to hear about "bugs" if anybody has experienced them.

Cross-posted to:
alt.radio.pirate,rec.radio.amateur.homegrown,rec.radio.amateur.misc,rec.radio.amateur.equipment,alt.ham-radio.vhf-uhf

I am experimenting with a Ramsey FM-6 to be placed on a bicycle racer for an ultra-marathon event. This, I hope, will allow the rider to communicate his needs to a crew which will be closely following him in a pace van.

The problem, however, is that the FM-6 was designed to be a "bug". That is to say that it collects all ambient sounds and transmits them at the same levels. This makes monitoring the frequency exceedingly difficult. Road, wind and many other sounds must be sifted through to hear what the rider might be saying. This is places an unacceptable burden on the crew. We have attempted to put a good sock on the mic, but that did not help at all.

So here's the question: Does anyone know of a (simple) way to filter the FM-6 so that only the voice range (300 to 3000Hz) will be heard?

If you think that this could be solved, please e-mail me.

Thanks,

Charlie

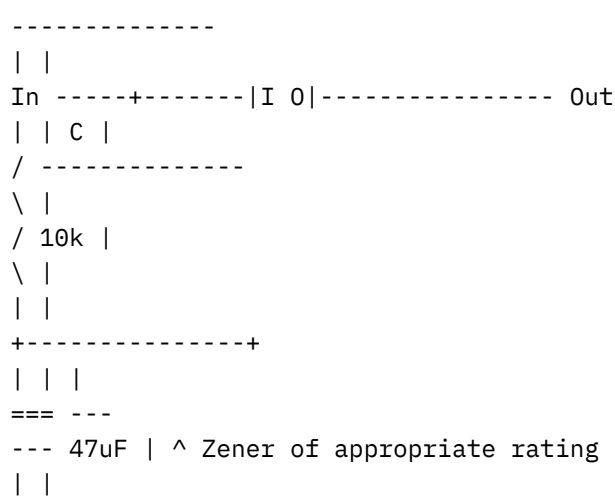
>voltage by 1.8 volts (0.6 volts per diode drop).

There's a gotcha related to this :

I once needed a 24V 2A supply for a tape streamer. Now, the local electronics shop only stocked the 78Sxx's up to the 78S15 (15V), so I decided to use that and put a 9.1V zener between the common pin of the regulator and ground, with a 10k (or thereabouts) resistor from the input to the top of the zener to ensure the zener was passing a sensible current.

It worked fine off-load, but when I powered it up with the streamer connected, the output was very low. Experimentation proved that connecting it to the streamer after powerup was OK, as was shorting out the zener and powering it up with the streamer connected. In the latter case, the regulator gave out 15V, of course, and upon removing the short across the zener, the output rose to 24V and stayed there.

I finally discovered that the switch-on current of the streamer was enough to cause the output pin of the regulator to be below 9V for a significant time after power-up. Thus, the output was more negative than the common pin, which caused the 78S15 to go into shutdown mode. I finally cured it by connecting a capacitor of a few 10's of uF across the zener to give a 'soft start'. It now works fine...



```
| |
Gnd-----+---------------+----------------- Gnd
```

>Note that the regulator will have to drop 10.2 volts to get from
>24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it
>very well. A TO-3 cased regulator might be a better choice (again
>use a mounting kit, you can't ground the case). The added diodes
>need to be rated for the current as well.

If you're using diodes or zeners to 'jack up' a regulator, they only carry the (low) current needed by the regulator itself, not the load current. They don't need to be highly rated.

TH what? That's what I thought when a friend showed it to me. This unit is a handheld, dual band HT which looks like a flip-style cell phone, complete with cheap, short pull out antenna. It puts out 100 mW max & was intended for use as a remote with a kenwood 742 mobile rig in crossband repeat mode.

I don't believe it was intended for the U.S. market, & as a result it only operates in the euro bands (144-146 & 430-440mHz). Before I buy it, I'm wondering if there is a mod to extend it for use in the US bandwidth.

My experience with NIMH batteries... poor performance.

The NIMH batteries did give longer talk times than the NiCads. For a while. But the NiCads which had been used with roughly the same duty cycle lasted about twice as long before requiring pack replacement. The NiMH batteries would last about 9 months to a year, and then be totally shot, unable to hold a charge at all. The NiCads were going on at least twice this long, and were still in service when I left that job.

The radios were Motorola Visars, and they were used by a city government, with high duty cycles, and no attention paid to running batteries down prior to recharging, etc.

I believe the "memory" effect of NiCads has been eliminated with newer cells. We have NiCad batteries for our GP-300 portables at work that get charged whenever we're not running calls (ambulance company) on rapid chargers, and the original batteries that came with the radios are still performing fine after 3-4 years (!!).

NiMH batteries also suffer from a fast self-discharge rate. If you don't use and charge the battery on an almost daily basis, they become quite inconvenient. Most NiMH cells lose their charge at a rate of about 10% per day.

Your milage may vary...

796. Yaesu FT-50R MAHA Battery and FNB-41 versus FNB-40

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-15 00:00:00 UTC
From: dklaver@tulsa.oklahoma.net
Message-ID: <4sckmt$ra7@dns.okc>
Source record: 197885

I discovered that MAHA, Inc. has a Nickel Metal Hydride NiMH replacement battery for the Yaesu FT-50R dual band handheld. Does anyone have experience with MAHA? The batteries are supposed to work with the Yaesu drop in charger or the trickle charger. I'm interested in the NiMH battery due to its "no memory" characteristics. I am told the NiMH battery is all around better than a NiCad. I'd appreciate any feedback - especially regarding MAHA.

One more question....How much larger is the FNB-41 versus the FNB-40? I have the FBN-40 because I wanted the smaller size. I'm considering the MAHA for a second battery but they only have the larger size. Anyone with both battery sizes of packs that would care to comment? Any preferences & why?

Thanks,

Denny Klaver WB0PYJ

In article <1996Jul13.080226.26905@ke4zv.atl.ga.us>, gary@ke4zv.atl.ga.us
says...
|
|You can raise the voltage of the common 12 volt three terminal
|regulators (7812, LM340, etc) by putting diodes in series with the
|common terminal to chassis (note that you have to use an insulated
|mounting for the tab, IE a mica washer). 3 diodes will increase the
|voltage by 1.8 volts (0.6 volts per diode drop).
|
|Note that the regulator will have to drop 10.2 volts to get from
|24 to 13.8 volts. At 1.5 amps, that's about 16 watts. Heatsink it
|very well. A TO-3 cased regulator might be a better choice (again
|use a mounting kit, you can't ground the case). The added diodes
|need to be rated for the current as well.
|
No, the current though the diodes is only 10mA or so, so any type diode
will do.

801. PLL problem on IC751

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-15 00:00:00 UTC
From: frode@dxcern.cern.ch
Message-ID: <DuKxJA.90C@news.cern.ch>
Source record: 197890

I have an ICOM IC-751 which from time to time fails to work. I have isolated the problem to the PLL board, where I have found that the main loop does not lock when this problem occurs. The irritating thing is that when I get back to the radio a few hours later to continue with the fault finding it works OK again. Has anybody had a similar failure or does anybody have any clues on what might be wrong?

802. IC706 - remote control via the front panel cable?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-15 00:00:00 UTC
From: H&#65533;kan Bergz&#65533;n <hakan.bergzen@enator.se>
Message-ID: <31EA96A2.58DE@enator.se>
Source record: 197891

Hello all,
I would like to remote control my IC706. However, the CI-V interface does not support the control capabilities that I need, such as power control, interference measurement (S meter reading), SWR reading, filter bandwidth setting etc.

Has anybody taken a look at the protocol/interface available by the possibility to separate the front panel from the main transceiver? If this is a 'not too complicated' digital interface it ought to be possible to remote control the IC706 via that interface instead (thus throwing the front panel overboard :-)

Still hopeful...

Source record: 197894

Hi all from Calgary. A friend has asked me to program and tune a Motorola MCX-100 for various 2m frequencies. The complication lies in the fact that this radio has an R2 VFO, with a dual front end. The R2, I believe, is spec'd to work from 146-174 MHz. My friend's frequency list includes several channels between 144 and 146 MHz.

Is it possible to modify the radio to work in the 144-146 MHz range? Or will it perhaps even be forgiving enough to do the job with just some tuning? I'd also appreciate hearing about an inexpensive source of PROM's (aside from Motorola - NOT cheap!!)

Hi Gary, Yes I agree that your statement is correct in those
circumstances...and of course you are right in saying go as far as
the application requires. We know how many misunderstandings ther are
of VSWR and the undue concern some people feel to get to a very low figure.
I know of several hams who have sought Birds believing that the
situation demands it.

The DX-70's is useless, even after being 'fixed' at the factory. Except
on 10 meters, I can't tell if it's on or off - on ten it slightly
dimishes sparkplug noise, but doesn't help any other impulse type noise
(such as from the air condx electric clutch, etc). For all the good it
does, they should have left it out and used the button for something that
worked. Sigh.

Source record: 197901

Personally, I don't care for Bird wattmeters. This is, of course, if we are talking about Bird model 43 or similar. My reason is because the range splits are perfectly stupid and make them difficult to use. For example:

Radio on the bench is a 110 watt Micor. What slug do you chose? Do you use the 100 watt slug and pin the meter when doing your transmitter alignment or instead use the 250 watt slug and deal with less than half scale meter deflection?

The same sincero is true with a 250 watt base station. Do you use the 250 watt slug or the 500 watt version?

It is for this reason I prefer the Telewave portable meter. It comes with a 5, 15, 50, 150 and 500 watt range selection. This is in a wide band package. I don't have a need to change slugs to gain accuracy as my meter is pretty much flat about 100 mhz. Almost everything I do is VHF and above except when I have to go to align a six or ten meter base station. (Normally a 100 watt or 250 watt Micor base station on 52.525 or 29.6.) When this occurs, I just look at the compensation chart and know I am about right.

The Telewave meter has saved me a bunch in slugs and is one easy to carry unit in one piece.

I will say I prefer the Bird Termaline meter for on the bench use. Nice unit good for 150 watts in four ranges. Good product.

Kevin KA0JQO

Someone asked me for a breakdown on Mitrek mobiles. I'll do that one in a while when more moments are available.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

From: dklaver@tulsa.oklahoma.net
Message-ID: <4scc6e$mv6@dns.okc>
Source record: 197905

The FT-50R is a great radio. I've been very please so far. It is not a "true dual band" with simul. receive. Yet - being able to transmit on two bands in one small (yet sturdy) handheld for a fair price is all I was looking for. I've had others HT's not hold up. I'm hoping the "mil-spec" - tougher design will make this one last. Time will tell on that issue.

It's one radio that I will tuck along with me nearly anywhere I go. It won't replace the need for a higher powered mobile unit - but it sure is nice to have a sturdy radio in such a small package. I'm also happy that the keypad numbers are on the unit and not on the rubber pads. The numbers on my last ICOM HT wore off quickly.

The audio is also FANTASTIC! My experience with other brands and models has been disappointing - you couldn't drive the audio up without distortion. The FT-50R has great audio output - loud and clear - especially for it's size. It doesn't get distorted at higher volumes like others I've owned.

From: turner@safety.ics.uci.edu
Message-ID: <4set42$3e4@safety.ics.uci.edu>
Source record: 197907

charles1@netcom.com (charles copeland) writes:

>What are the shortcomings of a TS130?

None, really. If you really want a modern, now-a go-go rig with all bells and whistles I suppose you could call the lack of them a problem, but the rig is around 15 years old. It has a working noise blanker, a decent audio speech processor, incorporates a frequency counter for readout, has provision for accessory SSB and CW filters, it is fairly small and light, and works well.

>Does it have any known common failures?

Not that I know of in the few that I have owned. There are a few things that happen to older rigs, but that is not the 130 doing it. Connectors, corrosion, dust, etc. Mainly, you need to check the radio out thoroughly before you buy. Make sure you get 100 + watts out on each and every band, CW and SSB. Check the filters. Get an audio report. See how hot the heat sink gets when you use it. Check the current draw when you transmit. Use it on 10 meters to see if it hears well up there.

>Are the solid state finals pretty tough?

Yes. They are fine.

>Would you buy this rig, or only consider a newer model with added features?

That is entirely up to you. It is all personal taste. IF you can buy a 130 for under $400 and it is in good shape with an extra or two, I think you get a good deal and won't lose if you need to pass it on and sell it to another.

>How about removing the resistor alltogether and using the regulator
>bias current to (a few 10s of mA) to provide the drop across the zener.

Some of the lower-current regulators don't provide enough bias current
to let the zener stabilise. I was caught by that once as well, and now
prefer to include a resistor if possible. The extra cost of the resistor
and soft-start capacitor is minimal, and it ensures that the design is
reliable.

>A couple of 0.1uF capacitors between input and common and output and
>common on the regulator to avoid instability.

Agreed. I did include them (well, 0.22uF actually), but I didn't put them
on the ASCII-art schematic as I though they were 'obvious'.

>I have used an LED for the zener, with a 12V regulator you get 13.9V and
>an "ON" indicator.

I like that. I assume it must be a red LED to drop 1.8V

JustMe wrote:

> when you had to learn morse code to get your license,

Yes, it was the summer of 1949, I rented for $5 a month
a crack-up, spring motor Instructograph, paper tape
code teaching machine. Spent hours with that thing, and
got up to 13 wpm in 3 months or so. Passed my license
test as a Class B in 1950.

>when you converted
> surplus radios back in the 50's, when you built your own equipment and
> were so excited when you got it working and actually made a contact in
>CW.

Of course, the little ARC-5 set up I had, was real cheap. Ads
all over the pages of QST and CQ were offering them for $3or 4
each!! Had to remove the little motor/generator gadget on the
back, and build on a little filament and B supply. Had to
rewire the filaments, as I vaguely remember. Actually,
these were my 2nd rcvr's, had them for both 40 and 80 CW.
First rcvr was also a superregen job; built up from parts
I had to order by mail from Allied, Concord and Burnstein and
Applebee; lived out in the middle of nowhere, so mail was the
way to get stuff. Forgotten the ARC or BC numbers of all the
stuff I had.

>"cat's whisker",

I still have one; looks exactlly the same
as the one at the upper right corner of my OOTC certificate,
#3040!! Also have a box of galena crystals, some of them were
pretty "hot" as I recall, from my pre superegen SWL listeneing
days.

>a CK-722, a 6L6, a 1N21, a J-38, a geranium diode, a
> 35Z5, a 12SN7, an ARC-5 ? What are these strange terms?

Unfortunately, after a few QTH moves, particularly out here
to KH6 land, I have tossed most of my old stuff, too bad.

> I can vividly remember the glow of the
> burning filaments of the vacume tubes

My power supply I built for my ARC-5 40 meter CW rig, had a
pair of beautiful glowing mercury vapor rectifiers, plus

two maroon glowing voltage regulator tubes. It was probably
the most impressive sight for visitors to my station! And I
loved it. The glows rose and fell with the keying of the rig,
it was great.

>
>If you're using diodes or zeners to 'jack up' a regulator, they only
>carry the (low) current needed by the regulator itself, not the load
>current. They don't need to be highly rated.

Yeah, that's right. For some reason I was thinking the regulator
was a shunt regulator. It isn't, of course. It's a series pass
design. So the main current goes from input to output, and very
little flows through the reference pin, probably only a couple
of mils.

I've thought of another thing too. Most of the TO-220 3 terminal
regulators can only handle 1 amp. This application needs more
current. A solution to that, at the cost of another 0.6 volt,
can be had by having the regulator drive the base of a series
pass transistor like a 2N3055. Then the regulator transistor
handles the heavy current and the 3 terminal regulator only has
to handle the output current divided by the beta of the 2N3055,
or about 50 times less. The downside is you lose the overcurrent
shutdown feature of the 3 terminal regulator when you do this.
In this application, a fast fuse should substitute nicely, but
another transistor could be added to starve base current to
the 2N3055 during overcurrent periods.

Gary

Sure do. ARC-5's on 40 and 80 were my first receivers. I used them
in my college dorm room to copy 1AW code practice.

I also nibbled the corners of xtals with dykes to change frequecy
when I had two that were too close.

838. ARRL lawyer to sue member

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-16 00:00:00 UTC
From: "James S. Kaplan" <kg7fu@combined.com>
Message-ID: <01bb739f.8e9f00c0$7f8260ce@surf.rio.com>
Source record: 197728
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

ARRL lawyer to sue member

The following is a copy of a message I received today from
ARRL General Counsel Christopher D. Imlay N3AKD:

To: James S. Kaplan, KG7FU
Copies: Mary Lou Brown, NM7N
Terry Baun
John Poray
Date: July 16, 1996
Re: Your article, SBE Chapter 124 Newsletter, July, 1996
****

Jim, I have just finished reading your article in the July,
1996 Water Cooled Newsletter, page 6. In it, you argue that two of
my clients, the American Radio Relay League, Inc. and the Society
of Broadcast Engineers, Inc. should cooperate in certain government
relations projects, specifically spectrum protection. You note that
I serve as the General Counsel for both organizations. You then
jump from that argument to the following, which I quote:

If Mr. Imlay can't resolve HIS OWN conflicts of interest,
perhaps both ARRL and SBE should be seeking more
effective counsel. No offense Chris, but we have work to
do. We should not only be sending a message to the FCC
and Congress, but to other radio industries.

(emphasis in original)

It is not useful for me to educate you on the subject of your
article to correct the errors in it, and I do not intend to do so.
What I do intend, however, is for you to print a retraction, in
unambiguous terms, in a form acceptable to me, and to furnish to
me, in writing, an assurance that such will be printed in the next
Chapter Newsletter for Chapter 124. Failing that, I am going to sue
you in the District of Columbia for libel.

I have no intention of allowing you to falsely allege that I
have a conflict of interest in representing two of my best clients,
especially in an SBE publication. You are not entitled to damage my
reputation as a lawyer, which you have done in your article, or to
infer (without any basis at all) that I have violated the canons of
ethics governing attorneys, by which I govern my actions.

I will await your response.

Chris Imlay, N3AKD

And here is my reply:

Dear Mr. Imlay:

Thank you for reading my column in the SBE Chapter 124 Newsletter "Water Cooled".

I will not be giving you a retraction for any of my statements published in the July 1996 issue as you have requested. My statements are my personal opinions and views. I do apologize if you feel you have been hurt or damaged by my statements. My intent is to spur thought and action, not to personally attack. If your actions require others to think or act, don't you think they have the right to be informed? I believe my statements to be true and have been given no reason to retract them. My statements, by the way, are my own and don't necessarily reflect the views or opinions of Chapter 124, it's officers or members.

I am a member in good standing of both groups and do many hours of unpaid work for the benefit of both groups and their members. I take personal offense at the threat of lawsuit by their counsel. It is unprofessional and you are certainly coming close to conflict with your fiduciary duty to both groups by proposing to sue a member. Perhaps it is you who owe me, and the Society of Broadcast Engineers and the American Radio Relay League an explanation for your actions and your lack of action in certain critical spectrum protection matters.

After much discussion with SBE and ARRL BOD persons and members I have decided that the best way to deal with this matter is to offer you the chance to refute my statements or rebut, in your own words, in my column for publication in the next issue. In other words, please give yourself the chance to "educate me on the subject of my article to correct the errors in it".

I know you'll also agree that, if you choose to pursue litigation, the proper forum for legal action would be an Oregon court as the column was written and published here.

Sincerely,

James S. Kaplan KG7FU

Hi all.

We are launching Shock Wave Magazine.
"The European Communication Magazine"

This is based on a non profit structure.
We will publish in 3 languages over Europe.
Shock Wave will beprinted on paper.

Subjects:

- Telephony
- Computer communications
- Radio Communication : HAM, CB, SWL

Thsi mag will be connected to its WEB site where tested softs or
articles will be available..

Come and visit us and express your feelings.

http://www.spiraweb.com/shockwave

Yes, I remember all those things too. Your posting brought back a lot of fond memories. Got my novice ticket in 1952 while living in Redwood City, CA. Although I prefer the modern equipment we have today I have built a lot of my own equipment, because that activity is what excited me the most about the hobby. My first station was a Hallicrafters S-20R that my dad had kicking around. It didn't even have RF input stage. DX was any signal on 80M outside of the state. The transmitter was a single 6V6-GT with power xfr & 5Y3 built on a bread pan that I filtched out of mom's cubboard. The circuit was in Radio-Tv News. After a few years I rebuilt an ARC-5 using a 6146 and a 12AT7 as the Carter modulator on AM for mobile. The receiver was a Morrow 3 Band converter piped into the car's AM radio. Power came from a war surplus dynamotor. We had a pretty active group on 3995 KC (remember that term?).

Thanks for the nostalgia.

Sorry about the last foul up. Does anyone have mods for a Ranger RCI-2950?
I recently purchased a used one which has never been opened. It has cb
frequencies stored in it, and it will receive them, but you can't set those
channels. I am thinking the previous owner must have known some key combination to do this.
Also, is there a way to store the repeater splits in the memory
channels? Any help would be appreciated.

One of my ARRL books from the 60s (Understanding Amateur Radio) showed how to increase xtal frequency by grinding it. You'd slide it in a figure-8 pattern over some abrasive powder.

My first rig was a Heath DX-60B with the HG-10 VFO so I didn't have to resort to using xtals.

IC-2340H IC-2350H
Cross Band Repeater Access Codes

FRONT PANEL ACCESS

1. Set the radio for desired frequencies.

2. Push [VHF MAIN], [UHF MAIN], and [SET] simultaneously.

4. To turn off the repeater press [SET] for 1 second.

SETUP FOR REMOTE ACCESS

1. Set the IC-2340H to desired frequencies.

2. Press [DTMF/SCAN] until "REMO" is shown on display.

REMOTE ACCESS (sub band frequency is the control frequency)
Need decode/encode capability for this to work.
1. Enable the control frequency by holding the [MAIN/SUB]. This
will place "SUB" on the display.

2. (Remote Control on) Press [B], {password}**, and [#].
"REMO" and "SUB" will flash on IC-2340H display.

3. (Repeater on) Press [D], [B], and [*].

4. (Repeater off) Press [B], {password}**, and [#]

5. (Remote control off) Press [B], and [*].

** Password is optional if enabled through the setup function of the
radio.

I do, I do. The cheapest/best receiver I ever had was a BC455? that covered 40m mixed down to the BC453? tunable 455KHz frequency with the 50KHz IF. Dang, that was a good receiver.

Did you ever spend hours removing the base of the $1 JAN 1625s so you could separate the suppressor grid from the control grid only to find out they were also tied together inside the glass envelope? So forgit the cheap grounded grid amp.

>I treasure it and am proud to be an original "HOME BREW" ham for

>the specifications for vehicular electronics system is more
>stringent that Mil Spec, you might get worried. Any one with some
>facts to fill in?

The vehicle power buss is very dirty. During starting, transients
of 300 volts are not uncommon. Any time an inductive load switches
on or off (a fan motor for example), there will be a nasty spike.
Any electronics used in a vehicle needs suppressors to protect it
from these spikes and surges. That's normally built into equipment
designed to operate in the auto environment. But if you build something
yourself to put in the car, make sure you use adequate suppression
and filtering.

It is also normal for the vehicle electrical buss to vary from as
low as 10.5 volts to as high as 14.8 volts during normal operation.
So use of regulation is highly recomended for equipment which won't
tolerate fairly wide voltage swings. Once the alternator has recharged
the battery from the starting drain, the voltage will normally stay
in the range of 13.8-14.2 volts on the vehicle buss. But during peak
charging, voltage will rise to 14.8 volts, and if you run equipment
with the engine off, the battery can go down to 10.5 volts as it
nears the point where it is so discharged that it won't start the
car. (You should never let a car battery discharge below 10.5 volts
or you'll shorten its life.)

A number of ham rigs get *real* squirrelly when the voltage drops
below 11 volts. You can get that at the rear terminals of the radio
even with the battery at full charge if you have significant resistance
in the wiring to the radio. 1.3 ohms will drop 1 volt for each ampere
of draw. With a radio requiring 10 amps, you could wind up with nearly
zero volts at the back of the equipment if the resistance of the total
wiring between the battery and the radio were only an ohm. You want
wiring that has a total resistance in the 1/100ths of an ohm range.
Use heavy cables and good connectors.

To All interested in community service and message traffic handling.

NACEC, The North American Center For Emergency Communications is looking for community minded volunteers. NACEC is a Not-For-Profit Corporation existing to serve the public interest since 1992.

Our volunteers provide an important link between this organization and their communities or military installations, helping with the growth of this organization, the movement of information into and out of their communities, as well as providing a valuable community service. One of the services that a special group of our volunteers provide is message handling for U.S. Military Families Worldwide and the Survivors of Large Scale Disaster throughout North America.

Our all volunteer message handling network now serves several thousand locations across some 6 countries and our hope is to expand this to 10's of thousands of location by the end of this year.

I would like to extend my personal invitation for you to review our organization and consider becoming a NACEC Volunteer. Information and an electronic volunteer application form is available at our Web site, which can be found at:

http://www.nacec.org

Thank Your for your time and consideration.

Sincerely,

Mr. Edward Addy
Executive Director, NACEC

Of course, being an amateur operator who understands watts vs dB, you
already know that tuning that 110W Micor down to 99 watts output isn't
going to affect your signal strength ten miles away. It DOES keep the
needle off the peg, lets your bench power supply run a bit cooler, and
also lets you stay with the 100W slug.

And most high power tubed base stations are MUCH happier running between
70 and 85% of the maximum rated output power (keep the screen current near
spec, NEVER negative). Just remember, 3dB is half of an S-unit, but the
power company will charge you twice as much for it!

I guess I found a real bargain - I've been getting RF noise for years from
my local power utility free of charge. If I could just convince them to
charge for it, I'd cancel that part of my electric service immediately!

%
% So here's the question: Does anyone know of a (simple) way to filter
% the FM-6 so that only the voice range (300 to 3000Hz) will be heard?

That's not what you want to do. Instead of trying to limit the
frequency response, disable the AGC. Make sure that the mike is then
the right distance from the speaker's mouth. If totally disabling the
AGC doesn't work well, you might want to just back off the AGC for less
compression.

Replace the 4 PLL trimmer caps. These are plastic and over time will go bad. Here in the States ICOM will sell ceramic replacements. These caps are labeled C78, C88, C97 and C107. Also inspect all electrolitic caps on the pll unit for overheating ,bulging or discoloration and replace. Also check for bad solder joints in the regulator section of the pll unit.

863. Re: Downside of owning a TS130 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-16 00:00:00 UTC
From: donrm@sr.hp.com
Message-ID: <4sgqmi$ieg@canyon.sr.hp.com>
Source record: 197753

charles copeland (charles1@netcom.com) wrote:

> What are the shortcomings of a TS130?

None that I've ever heard of. It's one of the few Kenwood radios that hasn't had a service bulletin issued against it (that I know of). Mine is 15 years old and *never* had a problem with it other than a noisy switch (which a squirt from contact cleaner fixed.)

> Does it have any known common failures?

The only one I've heard of (and seen) is oscillation on the 10M band if the radio is looking into a "radical" VSWR - but then, all bets are off. The earlier TS-120 had this problem which was traced down to loose PC board mounting/grounding screws.

> Are the solid state finals pretty tough?

Well, mine has withstood about 15 seconds of the oscillation mentioned above without damage. My 130 also has the thermostatically controlled fan which has come on about five times in the past 15 years.

> Would you buy this rig, or only consider a newer model with added features?

I'd buy another one. It's one of few tranceivers around that one can work on at home without the use of a microscope, logic analyzer, or memory maps. There's a few mods for it, like shutting off the display and pilot lights for power saving operation. If you're going to use it mobile, you don't want one of the new fancy transceivers with all the knobs and geegaws. Just be sure your ARRL insurance covers it. (You do belong to the ARRL, right???)

Go for it...

Universal Magnetic Balun, Modle UMB 130.

This is a receive only Longwire and dipole antenna to feed matching
Balun and earth isolator. A reduction in Mains borne noise is achieved
by the Longwire antenna return path being isolated from the
receiver/mains earth. The UMB 130 frequency range is 100khz to 30Mhz.

Receiving Antenna Combiner, Model RAC 130.

This is a passive transformer combiner/splitter specifically designed
for two antennas to feed a single receiver to reduce the effects of
fading. To provide optimum performance a phase inverter can be
switched to allow the antennas to combine in either phase or
anti-phase, this prevents signal cancellation due to the phase
difference between the antennas. The RAC 130 is designed for 100khz to
30Mhz.

Antenna Feeder Isolator, Model AFI 130

This is a receiving only, feeder isolator which reduces mains borne
noise (TVs, Computers etc.) from being coupled to the antenna feeder.
The AFI 130 is most effecive when used with Longwire type antennas and
"Longwire Baluns". The frequency range of the AFI 130 is 100khz to
30Mhz.

Short-wave Antenna Controller, Model AC 330.

This is the forerunner of a device that was originally designed in the
late eighties to combat the jamming of the HF Broadcast Bands. The
AC130 is currently being re-developed and scheduled for release in
late 96. This will be a passive receive only antenna controller that
will use two simple vertical antennas to provide uni-directional
reception with up to 20dB front to back ratio. This antenna controller
connects directly to the receiver so that the user can electronically
steer a null to reduce local and skywave interference.

The above products currently cost:-

UMB 130 £24.95 plus £2.00 UK postage elsewhere at cost
RAC 130 £29.95 " " "

AFI 130 ⍰18.95 " " "

On this point, at least, you are wrong. "Any amateur station may be a space station. A holder of any class operator license may be the control operator of a space station..." in 97.207.

> You obviously have not been licensed since 1977 when the FCC stated in an
> response to a group's inquiry that reverse autopatch can ONLY be used if
> the cotnrol op SCREENS THE CALL OFF THE AIR FIRST before ANY signal is
> transmitted.

Gee, I missed 1977 by a month or two... shucks! ;)

> Also there is NO mention of AUTOPATCHING to my business in the FCC rules as
> being illegal....but third party tfc to my business is...and thats what an
> autopatch is!

Have you not heard of the famous "pizza rule?" True, you should not autopatch YOUR business because you have pecuniary interest... but an autopatch to "order a pizza" was deemed legal awhile back. The FCC is always in a state of "relaxing" their rules it seems.

Perhaps you are correct on the reverse autopatching, but I am still not thoroughly convinced of that. And even so, if it is illegal, I do not think that it will remain so. It just doesn't really make sense for a repeater announcement (ie, "ring") to be called 3rd party communication... it is not a "communication" at all, until the call is accepted by a control operator and "information" is exchanged between PEOPLE. Other than that, it is a "status report" given by a machine.

Best regards, Stan/KD9BE

12SN7, an ARC-5 ? What are these strange terms?
> Yep - most of the stuff. I recall talking my dad into buying me a couple of CK722's and, after a minor
false start, having him help me build an AM RX from the Raytheon "apps book". (basically a crystal set
with a CK722 AF amp. the detector diode may well have been a germainum diode, don't recall for sure.)

I can vividly remember the glow of the burning filaments of the vacume tubes in the receiver built from
the plans in Popular Mechanics. My first short wave receiver.

Last year, my dad sent me his not-too-old (relatively speaking) Drake R-4B. Did a little cleanup, then
fired it up. My two Jr. Ops, then age 12 and 10, came wandering in. "Is that the radio Grandpa sent?"
"Does it work?" (yes, it did.) "COOL!!" Then, a pause, silent peering into the cabinet... "Dad, what are
all those LIGHT BULBS bulbs inside??"
age
>
> My special thanks to Bill Welch, W6DDB, formely W1SAD in Waltham, MA(circa 1954) who tutored me in my first license at the El-Ray radio club of Ratheon. Thanks Bill for all the many years of fun and
enjoyement. I don't know where you are but I hope and pray that you are well. If any one knows Bill,
please pass this on to him. Thanks.

FYI, Bill is still around - Lancaster, CA, I believe. Ran into him on 40 CW about a year ago, and figured
out I had hooked up with one of the good guys. I was trying to re-create my always marginal CW skills, and
Bill hung in there patiently. Great discussion, talked about our Boy Scout leader experiences, etc. Just
got a recent CQ magazine from a friend, Bill had an article. It was about getting started in ham radio, as

I recall. Seems to fit the guy's image!

Thanks for letting me "nostalgize" a bit. I have temporarily lapsed to appliance operator, but I still
have a garage full of partially finished projects and a large junk box of parts. Does that qualify?

Hello Tim:
To answer your question I had the same problem until I changed the baud rate on the radio to match the software at 9600 baud. Check your manual for how to change your baud rate or I can look it up for you. I did it by pushing a few buttons and turning on the rig.
I have the optoelectronics cx-12 (similar to the CT-17) interface and able to control a Icom R7000, R7100, 706 and a RS 2006 with opto 456 board. I usually scan or search with the R7000, 7100 and 2006 all at the same time using Scanstar for windows software and one or two comm port's.
With Scancat Gold I am able to control the Icom 735 or 706 and the Icom 7000 or 7100 using the cx-12 interface and the C-IV cables and "jumping" from one radio to the other.
You probably already know that if you connect a C-IV cable (1/8" male mono on both ends patch cord) from one radio like the 7000 to a 7100, tuning one radio's dial or mode will control the other radio.
At times it can get confusing if you connect all the rig's in a row with C-IV cables and jumpers. 2 or 3 is my limit !

Hope this helps !

I'm kind of in a nostalgic mood tonight and was remembering the good old days of Ham radio when 2 meters(AM only) was not just another CB band, when you had to learn morse code to get your license, when you converted surplus radios back in the 50's, when you built your own equipment and were so excited when you got it working and actually made a contact in CW. REMEMBER THOSE DAYS. Remember the days when you had to know something about electronics to get a license and to build and transmit your "HOME BREW" equipment. Does anyone know what the word means today ? Today the term "appliance operator" seems to be the norm. Does anyone remember a "cat's whisker", a CK-722, a 6L6, a 1N21, a J-38, a geranium diode, a 35Z5, a 12SN7, an ARC-5 ? What are these strange terms?

I built my first radio when I was 13 years old in 1953 and can remember going to the parts store and laying out pennys on the counter for the resisisters, capicitors and diodes. I can vividly remember the glow of the burning filaments of the vacume tubes in the receiver built from the plans in Popular Mechanics. My first short wave receiver. Super regenerative it was. And when I heard that first squeal of the oscillator I was hooked. No such thing as beams and yagis in those days. Just long wires and a good ground system, a radiator, if you could find it. Oh, but what a challenge!

I just renewed my license for another ten year and was looking at the "OLD TIMERS" certificate I received from the ARRL after being licensed for only 20 years. I treasure it and am proud to be an original "HOME BREW" ham for 40 years now. I am just wondering if it isn't time to start a place on the internet for rememberences of the good old days of the real ham radio. Any suggestions would be appreciated.

Bob W4GBB, ex WN1IIO, K7RIU, KX6CC

Virtually new condition

Matches 735 but works with many Icom radios, using proper cabling

Fast. Fully automatic. Presets. Bypass. Random wire post.

$450 + shipping from Portland, OR. Compact, lightweight unit.
--
Good faith comments. Expertise _not_ claimed. Corrections welcomed.

I believe the most "renowned" store in the Minneapolis neighborhood is
probably Radio City, Inc: 612-786-4475. They're located roughly 10-15
miles north of Minneapolis. So far I haven't had any problems with
them, and their prices are competitive.

I have one I got the last time they had a sale, it seems to work. I
haven't measured the actual power coming out of it, but its clear that the
preamp functions - I pickup a lot more noise when the computer is on!
anyway, for power its got 2 wires coming out the back. A couple of 239
connectors, and a power switch. No ability to switch in/out the preamp.

How about removing the resistor alltogether and using the regulator
bias current to (a few 10s of mA) to provide the drop across the zener.

A couple of 0.1uF capacitors between input and common and output and
common on the regulator to avoid instability.

I have used an LED for the zener, with a 12V regulator you get 13.9V and
an "ON" indicator.

883. Re: Alinco DX-70: Need remote kit and mod info.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-16 00:00:00 UTC
From: mreising@aol.com
Message-ID: <4sfthv$e1c@newsbf02.news.aol.com>
Source record: 197863

I bought two separation cables for my DX70 and attached them end to end using pins stuck in one of the female plugs. I then taped the plugs together. I have been using this setup since January 96 with no adverse performance from the radio, however, Alinco did not recommend extending the cable for the reasons mentioned previously. If you wish to roll your own, you might be able to buy the short jumper cable that connects the head when it is on the radio and use those plugs. Be aware that two of the wires are heavier gauge than the rest; you might have difficulty finding similar cable.

STUFF FOR SALE

$50.00
Almost new!
Entertainment center for up to 26" TV or larger, VCR and Stereo
plus other storage places

Possibly you could even put your radio setup in this one! :)

HAM Stuff

Battery Packs for HAM radio HT's
2 battery packs compatible with Icom and Realistic HT's
These are the battery shells that take standard AA cells that
Radio Shack sells
$10.00 One is empty and takes 6 AA cells
$30.00 The other has 6 new AA 650mAh rechargables included.
Only 3 days use at most.

$125.00
Must show or at least be able to prove you have a valid HAM licence to
purchase.
30 Watt 2 meter RF power amplifier
Custom built using Motorola RF power module.
300mW to 1.0 Watts in gets about 30Watts out.
Has 3 pole Voltage and capacitance tuneable helical filter built in
for receive to reduce intermod.
BNC input...SO-239 output. Heavy duty thick heatsink, 100% duty cycle
at 12V, compact size.
CLEAN output
Power module spuroius emissoins rated at 70db below carier.
12V to 16V

$50.00
2 bay folded dipole
138-174MHz
Commercial design with HEAVYduty clamps
Much the same as Sinclair 210C-2 infact it might be that

Computer parts

$25.00
486SX-25 CPU
Runs reliably as a 33MHz CPU

4 of these...
$5.00 each or $15.00 for all
Unknown make of network cards.
Assumed to be ARC NET type. 8 bit, BNC, possibly have boot proms as
well.
AMD chipset on them. These cards do work as they were pulled straight
from
service rescently.

$1.00
16bit MFM controller card. not sure of the state it's in.

$1.00 for both
do not know if they work...
2 8 bit I/O cards for floppy. Has DB36 female connector on rear of
card.

$4.00
I/O card for floppy. Half card. Has battery and BIOS with 2 serial,
1 game
and 1 LPT. 8 bit
I beleive this one does work.

$45.00
80 Meg Maxtor 2.5" 2585AT Hard drive. (laptop drive)
formats to 85,018,624 bytes. (DOS)
No bad sectors. Have the connection/power adaptor for standard equip.
Do not have the bay adaptor for this drive.

All private sale. Open to only REASONABLE offers!

If interested reply by email to kblack@execulink.com

Check this page too: http://www.execulink.com/~kblack/tech-net.html

Has anyone had a problem with the Push to Talk button on their FT-50R?
I looked down at my handheld this evening while scanning and noticed the
rubber PTT button was just dangling there. I have no idea how it happened. I
would expect the button to be tougher than this. I've handled it with care
the very few days I've had it.

I'd sure be interested to hear if anyone else has had this happen.

Thanks,
Denny

WRONG!!! READ part 97.3 and the definition of a repeater!!! A SIMPLEX
patch is NOT a repeater...and a repeater in the autopatch mode also falls
under third party rules.....and so does ANY other station...simplex or
otherwise...

NO a simplex patch is NOT a repeater....
but it IS a remotely controlled station...

One cheap/easy way to get close is using a TO-220 7815 (15 volts) to
run 2N3055 pass transistors. You get 14.1 to 14.2 volts. Pass transistors
can be run in parallel for more current. Don't forget emitter resistors.
Check the ARRL handbook 28-volt regulator article for an example of
running a bunch of 2N3055's off an IC regulator.

I use a 7815 and 8 2N3055's in a homebrew supply, and it's worked well.

I may be only a lowly "Techician", but it bothers me too. I put in the time and study to get my operating privledges. I'm considering writing Kenwood (for what good that would do) and letting them know that more than a few hams are worried about the trashing that's to come.

Kenwood is a big company, and if they want greater market share, the way to get it is to build a superior product and make attractive deals with their resellers. Their VP of marketing has forgotten who his REAL customers are.

With the reductions in force at the FCC's enforcement division, the writing on the wall worries me. 2M will likely be the first to fall, and what really worries me is that it will be like CB was 20 years ago... you had to have a license, then it got so bad with unlicensed operators that rather than enforcing the band, they just gave up.

You can bet that the sales folks at CB shops, truck stops etc don't give a rip whether or not their buyer is a licensed amateur operator or not.

Any ideas on how to fight Kenwood's move? For starters, I will vote with my dollars. As I move up the license classes, I will boycott Kenwood, and buy another brand. They aren't the only players.

What a wonderful idea. I was first licensed back in the 60s as WN4MPD later upgraded to technician as WA4MPD. My first receiver was a Knight Star Roamer I built from a kit. Also put together a Heath Sixer. My first six meter QSO was from Atlanta to West Palm Beach, Florida. Hey I thought this stuff was good. The next day after school I found out what skip was. Couldn't get West Palm Beach any more.....

Built a couple of six meter AM mobile rigs, WITH TUBES....remember fast heating filaments?

Ever hear of a military surplus receiver, RAL-7? Pretty good super regen with external power supply that had a ballast tube. Great heater for winter time operations.

Six meter quads were the antennas to build.

Held an additional station license while in Hawaii, KH6HCR. The FCC later changed the rules so that you could only hold one license so I dropped the WA4MPD and kept the KH6HCR. When I upgrade to Advanced Class I didn't want an AH6** call so I kept the KH6HCR. When I moved back to Atlanta I applied for a call sign change at received KD4RG. Now with Vanity Licensing I applied and have received my old WA4MPD. I guess I really should get back on the air.

Let me know when the Old Timers Group gets started.

What the combination number?? Like T7xRTNxxxx ????
In Motorola MICORs, the 1st NUMBER after the T is the power level (4,5,6,7 being common....7 is 100 watt model, lower numbers is lower power ranges)
SECOND number is band range (1 is lowband 30-50..does NOT cover that far...actually splits into three bands...30-36,36-42 and 42-50...2 is 72-76 Mhz Midband....3 is 144-174 Highband...4 is UHF 420-490)

> Motorola receiver model 01589A RC0129
>
> GE MT76TFS66 ET58F ER41C (some of these had an extra rx strip)

This is a GE MSTR PRO 100watt 144-174 Mhz radio....IT HAS TUBES (others known as foot warmers, empty state devices, etc) in the driver and final...

If you hold down the Monitor and Band buttons while turning on the unit (it takes three fingers and both hands) you open up receive capability. Receives from about 50 to 999 MHz with a few gaps. Seems to work good.

I LOVE the IC-T7A, it's pretty easy to use and has lots o' features for a good price. I paid $309 at a hamfest.

-> >be ok. Just don't attempt 24V. :)
->
-> Agreed. I've been wondering... How close to dead-on is a car's 13.8?
-> I bet at low rpm, it gets a bit low... How about on the high side?
-> Does it ever get up to 15vdc?

From the car's viewpoint, charging at 15v+ isn't good for the battery,
it causes to much chemical activity to take place. 15v is pretty much
the upper limit for an automotive charging system....the penalty for
overcharging being heavy battery gassing and subsequent "dry" batteries.
I haven't any idea about how it will affect the radio, though. FWIW.

Source record: 197683

It seems the FT-50R has to be out of service to use the Ni-Cad Battery Charger NC-60B. I wonder if there is an adaptor to charge the battery off the radio with the NC-60B.

Alternatively, I would like to use the ICOM BC-30 charger I have, but there is no adaptor to make the connection.

The Yaesu NC-50 (with CA-14 Charger Sleeve) is the only Yaesu alternative I know of.

908. Sony SW100S Information?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-17 00:00:00 UTC
From: Steve Wolf <no8m@apk.net>
Message-ID: <31ED43D2.17FF@apk.net>
Source record: 197688

Hi ...

I have a tiny Sony SW100S receiver (.1 to 30 MHz.) and am really
impressed with its features and performance. I bought it to listen to
shortwave but also finding myself in the ham bands quite a bit.
For those not familiar, it will easily fit into a shirt pocket,
uses 2 AA cells (which last weeks) and has a very impressive list of
features.

I am interested in modifications and operational hints. I tried
rec.radio.shortwave but I suspect (and see that) the non-amateurs don't
do much more than listen.

My questions are these:

1. The receiver will scan but when it comes into one of the popular
SW bands it becomes locked into a low and high frequency.
Although I try to scan .1 to 30, I end up in a much smaller
band. I bet there is a way to defeat the band features.
Anyone have any information?

2. Are there any mods?

Announcing NEW Ham Radio.FAQ

This file started as a regular USENET posting called "rec.radio.amateur
.misc Frequently Asked Questions".

The evolving file was distributed far and wide thanks to passionate
contributors. The file was abandoned in 1994 and is being
resurrected now
on the WWW for currency and convenience.

All help is welcomed!

Please scan the file. Know of links that should be added? Info that
should be corrected? Let me know!

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams
that you know or share with them the URL to this site:

There is no simple mod to allow the IC-706 to transmit on those
frequencies. You are aware that it would be illegal anyway aren't
you?

Steve,

Kantronics advertises with the KPC3 now that you can contact them for info on how to convert commercial pagers to amateur use. This is from their web server:

> NEW PRODUCT ANNOUNCEMENT
>
> AMATEUR PAGING
>
> If you're interested in emergency communications, remote control of equipment, or notification of important events, then digital paging for amateur radio just
> might be for you! And it's likely you or your fellow club members already have most of the equipment required for digital paging. The system requires a computer
> (or terminal), a KPC-9612 with paging firmware, a 9600 "data ready" transceiver, an antenna, and a few numeric or alphanumeric POCSAG pagers. If you're
> already 9600 active, all you'll need is the version 7.0 firmware for your KPC-9612, and pagers recrystalled for 2-meters or 70-cm.
>
> Kantronics' firmware upgrade v7.0 for the KPC-9612 supports the transmission and reception of Radiopaging Code No.1 (also known as POCSAG). This code is
> the defacto standard used by radio common carriers (commercial paging companies) supporting numeric and alphanumeric pagers. The upgrade supports all three
> paging rates -512, 1200, and 2400 - and includes a packet paging serverï¿½. With the server, amateurs may connect by packet radio to the KPC-9612 directly
> or to the K-Net node and send a page or inquire about pages already sent. A manual addendum included with the upgrade describes amateur paging and the
> keyboard and paging server commands added to the firmware. Associated with the upgrade, Kantronics is offering for sale the PAGER HANDBOOK for the
> Radio Amateur and Motorola Bravo Plusï¿½ pagers recrystalled for 2-meters and 70-cm.
>
> The PAGER HANDBOOK for the Radio Amateur, by W0XI, with eight chapters and five appendices, includes details of the POCSAG protocol (CCIR
> Recommendation R-584-1), transmission and reception requirements for paging, and instructions for recrystalling pagers for the 2-meter and 70-cm amateur bands.
> The handbook will be available in spiral bound format (GBC) April 15th and in paperback format (perfect binding) about May 15th.
>
> We recognize that frequency coordination for new modes/activities can be a problem. Hence, initially, we're offering refurbished Bravo Plus pagers crystalled for
> only one of several frequencies. These frequencies fall within the experimental and simplex sub-bands for 2-meters and 70-cm, according to the 95/96 ARRL
> repeater directory. In addition, we're soliciting recommendations for paging frequencies on a regional basis from the coordinating bodies. As frequencies become
> established and coordinated, Kantronics will stock crystals for these frequencies as well

and will offer a service for crystalling and programming pagers at the
> factory. Full details will be available later. Please keep in mind that the low prices you see for commercial pagers also carry a monthly access fee. Amateur digital
> paging carries no such fee.
>
> Some of the "data ready" transceivers sold today for 9600 baud packet operation are suitable paging transceivers. For example, Kenwood's TM-251, TM-451,
> TM-733, and Azden's PCS-9600D do a nice job of sending and receiving 1200 baud paging. Quality reception of paging signals requires a receiver with
> "discriminator" audio. You'll get marginal results with typical speaker audio; the audio amplifier must be bypassed for quality paging reception.
>
> Careful reading of Part 97 [sections 97.3(a)(10), 97.111(b)(2), 97.305(c), and 97.307(f)(5)] makes it clear that digital paging is allowed for VHF and UHF
> operations. One-way transmissions are made every day by amateurs to establish communication with other amateurs, even using one mode to establish a link in
> another mode. Paging simply creates another way of establishing communications. The rules also state that unspecified protocols/codes may be used for
> communications on 50 MHZ and above. Let's page!
>
> In summary, the KPC-9612 v7.0 firmware upgrade supports the transmission and reception of 512, 1200, and 2400 baud numeric and alphanumeric POCSAG
> paging, contains a packet paging server, page directory (pairs of callsigns and pager IDs [capcode]), a paging transmission log, and optional sysop controlled
> password operation. All features in v6.0 are retained. Version 7.0 adds nine keyboard commands: MYPAGE, PAGE, PAGECWID, PAGEDIR, PAGEMON,
> PAGELOG, PAGEPRIV, PAGEPSWD, and PAGETEXT. The unique features of the KPC-9612uit modem make amateur paging possible. Discrete RUH'
> modems cannot support paging. Paging firmware will not be supported in the KPC-3 or KAM Plus.
>
> Spring is here! Treat yourself to the v7.0 upgrade so you can be ready for paging activities.
>
> For further details, please write, fax, or e-mail Kantronics at 1202 E 23rd Street, Lawrence, KS 66046, fax 913-842-2031.

Take a look at this url for more info:http://www.kantronics.com/

Hope this helps you out. I think everything you want to do is legal by looking at it. The only grey area is that above it says paging is OK to establish communications with other amateurs... so a non-ham might not be ok to page. I don't know... maybe someone else will post with more info regarding this.

Good Luck

Kenny, KB5VME

922. FT8500 MARS/CAP Mod???

It's a one way communications, and would be illegal as such. The only legal one way transmissions I know of are messages of interest to the general Amateur population, like code practice and amateur related info.

> infractions on the FCC's regulations.
>
> -Dirk (N3TTI)

Dirk, you stated some things above that you obviously did NOT read in my
original post...and that was:
> ANY signal sent out on the air BEFORE a control op has screened it (EVEN ONE ring) is
> illegal...the FCC has stated that many times in the past....no different than a person
> walking into your shack and keying your radio and hitting a DTMF digit without YOU
> knowing about it first!

ANY signal that is caused by a NON amateur without a control op knowing
about it FIRST is considered illegal by the FCC! Even a reverse patch
that "rings" and announces the call on the air is illegal under FCC
interpretations...IF YOU DONT BELIEVE THIS, ASK THE FCC in Washington!

and you obviously have not followed the rules...your statement about the
system IDing itself before and after a transmission is not correct..
How does a system ID BEFORE a transmission??? (GRIN) and also the rules
only require an ID at the END of 10minutes during a conversation AND at
the final end of the conversation. Nothing is required at the beginning..

Reverse autopatches have NEVER been OPEN under FCC rules...they can only
be legally operated under STRICT rules and this is the word of the FCC
since 1977......(And their opinion on this has NOT changed since)

Hi, Dave.

Although I got my ticket in 1962, I, too, started out with a
Hallicrafters S-20R receiver. I don't remember how I got the S-20R, but
it was used when I procured it. I thought at the time that it had a very
stable BFO. Remember the coil instead of the PM in the speaker?

My first transmitter was a Heathkit DX-20 which I also got used. It was a
50 watt xtal-controlled CW 80-10/11 meter rig. As you know the 11 meter
coverage was included because it was part of the ham radio spectrum when
the rig was manufactured. I wish I could find a DX-20 in good condition.

929. Help Kenwood TV-506

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-17 00:00:00 UTC
From: Boyd N6DMF <blfulbri@sloc.net>
Message-ID: <31ED2A46.1036@sloc.net>
Source record: 197783

Hi,
I have a Kenwood Transverter model "TV-506" (6 meter), that
went with the Kenwood TS-520 & TS-820. What I am looking for
is how to hook it up to a different rig. I have a Icom IC-761
that I would like to run it with.

I would like to find someone that has hooked the TV-506 up
to another gig and talk to them to find out what they had to
do to make it work. I have the book on the transverter and
the service manuals on the 520 & 820, and have looked at the
schematic on them.

Any info would be appreciated....

Thanks,
Boyd N6DMF

From: cbrown@matnet.com
Message-ID: <7117cc$b153a.298@NEWS>
Source record: 197785
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.misc,rec.radio.amateur.equipment

Greetings all, I am looking for info on the construction of phasing coils (pitch/spacing/form dia/wire gauge/etc...) for 6m and up antennas (or down, though I am assuming the wavelength vs. material size would effect things on HF).

Also info on the pros/cons of using phasing coils or shorted stub delays. Does the better element spacing of the coil offset the radation from the coil, or is a shorted stub (at 90deg to the elements) better. How much does the position of the stub (at 90deg or folded against the element) effect antenna pattern?

All assumtions are made for 2 - 4 element VHF/UHF verticals.

Why would this be illegal??

1. You are not using it for commercial purposes.

2. Your son is only receiving, and does not need a licence.

3. As long as you ID, and don't encrypt the data.

4. Pick some weird simplex freqency, not down in the SSB/Amsat or
up in the link area.

5. No one complains.

Maybe un-ethical, but not illegal. Besides, if you've ever taken apart
a newer pager, you'd understand why I wouldn't worry, now they are
gutless
wonders, with about 2 chips. If you could find some old Pageboy I or
II's
you might be able to do it.

There are some commercial products out that are in the un-licenced 49
and 900
meg range to do just what you need, if you don't feel like a bunch of
work.

Yep was great mobile rig on 40 meter. Used 807 I think it was and
modulated the screen grid with audio. Worked great and stable too

Info from ICOM shows same advice for IC-761 PLL problems. I guess the
thing is to avoid plastic trimmer caps.

I totally agree. The first wiper-delay I built and installed in my '74 Chevy Nova worked perfectly. The second, using the identical circuit, installed in an '80 Chevy Malibu was flaky as hell. Turned out that the windshield-wiper motor, when it shut off, was spiking the buss with a huge, negative-going pulse (it blanked my scope even on it's highest voltage setting, 100V I think.)

That was a low-draw circuit, just a 555 and relay, so I build a simple L-C low-pass filter to clean it up. Neither the L nor the C by itself was enough.

Now my question is, with a high draw device such as a transmitter, is there a simple, passive filter that will accomplish the goal? Seems like the series inductor would have to use some pretty hefty gauge wire.

I have used the AUTEK research swr meter for aprox 1 year and found it accurate and easy to use. It could use a better on and off switch as it has a tendancy to get turned on accidently. I use it mainly for finding the resonant frequency of cut dipoles. It is well worth the price if you do much antenna work.

>the 2m band actually cuts off at about 140 MHz, so you can't

My 706 cut off around 125 MHz. At 140 it was completely deaf.

..
>In this latter mod, you take the yellow wire you disconnected
>in the type 1 mod and extend it to the bottom of the radio

>to pick up national wx.

Actually the switching transistor is activated above 129 MHz
which is just about perfect as the cross-over point of the LP
and 2m BP filters is about 126 MHz.

>There is a different solution, other than messing with yellow
>wires, to the problem which can give you coverage all the way
>to the 200 MHz upper tuning limit of the radio. This mod requires
..

Note that this may also cause severe intermod from the FM BC band
as the LP filter does not attenuate the signals from 87-108 MHz.

Here in the Helsinki area there are several high power (60 kW ERP)
transmitters and they made listening anything below 144 MHz
impossible due to intermod. After the yellow wire mod (type 2)
there is no problem above 129 MHz.

The FT-900 blanker works after the factory service bulletin is installed.
Before the mod it's useless.

One part of the mod is changing a resistor value to a test select value.
Suggest changing it to one the just slightly distorts the audio. You
will find the best performance then from the blanker. Only problem is
that you are dealing with surface mount components.
Happy tweaking! Dave. WA0ZZG.

948. Ham Pagers ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-17 00:00:00 UTC
From: oneal@earthlink.net
Message-ID: <31ec3c14.510628003@news.earthlink.net>
Source record: 197802

Anyone seen or heard of how to convert a commercial pager receiver to a Ham Radio frequency, say a simplex one. I would love to give my 10 year old a el cheapo pager when he's running around the neighborhood and then punch in some simplex freq, ID and then punch in a few tones which beeps my son. Hey might work so "She who must be obeyed" understands why I want that new $500 radio :)

Of course, I think this would probably be illegal, or close to it, but how would it be different than my new FT 50 which transmits a sub audio tone to another FT 50 and beeps me when we are in Simplex range? Think this feature works without me keying, radio does it for me.

Never did that, but did use a #2 pencil to lower the frequency, and even managed to use my dad's Comet cleanser-and-glass-plate method to raise the frequency - the trick was to use an even figure-8 motion. Now that's REAL ham radio!!!!

We have a web site for the hamfest....see below

http://home.aol.com/doug03

Well.... if you get this and still need more info let me know.

Don't forget the FIFTH ANNUAL USF "Last Minute" HAMFEST
Sat July 27th 9am to 3pm
in the ice cold air conditioning...

Hosted by the University of South Florida Radio and Electronics Club.

Admission $3.75
1st swap table $10 including ticket. Additional tables $10 each.
Call 1st for table reservations.
Call especially if you need more than 7 tables.
---
call (813) 979-0033 after 5pm

USF is easily located on Fletcher Ave between I-75 and I-275 in Tampa.
Enter campus on North Palm Dr. follow the signs to the
USF Special Events Center.

Just close enough to Busch Gardens to let the family go there while you play!

TESTING WILL TAKE PLACE AT 11AM.

TALK IN 147.24+, 146.94-,and 442.275+
Vendors may setup FRI NIGHT 6-9pm and SAT MORN 8-9am.

SEE YOU THERE!!!!

for more info, direct questions to: douglass@eng.usf.edu
See our web page for more information and maps.

Source record: 197811
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.equipment

A "simpatch" or those so-called "simplex repeaters" do not fit
the FCC definition of a repeater in that they do not
simultaneously transmit and receive. Therefor none of the
repeater-specific rules apply, and operation must be in
compliance with rules for non-repeater stations.

>board mounting/grounding screws.

Sort-of on the subject, but probably worth noting. I struggled like mad with a TS120 (NOT a 130!!!) with the higher-band oscillation problem. I sent it back to Kenweird 3 times for fixes, which were never successful, and they refunded my money. I have seen several version of the factory service fix (which involve adding resistors, bypass capacitors, screwing down the RF PC board, etc etc etc etc etc etc) and they are all JUNQUE!

Finally some helpful ham told me the fix, which was successful on the first try:

On the right-rear corner of the RF board (near where the connector leaves the board and goes into the PA compartment for the final amplifiers), scrape away about 1/4" square of the cadmium plating on the chassis, so that bare metal is exposed. Then, solder (use a tiny torch or a hot iron) a bit of compatible (for steel) solder onto the spot, and then jumper (with 1/8" braid such as solder wick) a very short (3/8" long) jumper from the spot onto the ground trace of the PC board right next to the standoff. I found it awfully strange, but it fixed the problem completely, where before Kenweird could not touch it. Anyway, it seems there is a metals compatibility problem between the standoffs and the chassis plating which deteriorates over time, and causes the oscillation.

Again, this is for the TS120, not the 130!

>Well, mine has withstood about 15 seconds of the oscillation mentioned
>above without damage. My 130 also has the thermostatically controlled
>fan which has come on about five times in the past 15 years.

Perhaps this is helpful...

Yes, this radio can come all the way down into the two meter band with
full power output and sensitivity. The alignment will have to be touched
up but it will go.

I have had several and had good results.

From: ej.mars@lagn.com
Message-ID: <30070277@lagn.com>
Source record: 197618

I posted this in the computer section and got no reply, so I'll try it here. I would like to know if there is a min or max voltage required for a mother board Memory battery. Some are 3.6v others are 6v. I was thinking of using 3- 1.5v AA cells or 4.5 volts. Would that be OK or would 2- 1.5v or 3 volts be better. Please send replies to ej.mars@lagn.com.

Thanks KC5EPI

Hi, just wanted to pass on to the group the problems I have been experiencing with 73 magazine. I have been a subscriber for 2 years now - soon to be an ex-subscriber. Since January of this year I have had to make a long distance call, monthly to get my issue (which I already paid for!!). Finally after thinking I was throwing good money after bad, I quit calling. Now no magazines for over two months!! What gives Uncle Wayne?? Pocketing my hard earned dollars and stiffing me for my magazines. I thought you were running a legit operation. Why should I have to 1) subscribe in advance to this magazine, with the alledged advantage of getting the editions before they hit the news rack and 2) continue to have to spend money by making long distance phone calls for something I already paid for and should be getting! Wayne says he is thrifty, but come on sir stop stiffing your loyal followers. Anyone knowing Wayne's e-mail address, please advise me or better yet - forward this to him! Hope you're having better luck than I am.

Soon to be tuning into CQ mag

Richard

From: rooster@iglou.iglou.com
Message-ID: <DupwDx.38H@iglou.com>
Source record: 197625

I recently passed the tech plus exam (36 years old, wife, 2 kids). so i went looking for a radio. well, the hobby fund isn't going to spring $3500 for a ft-1000.

I did some research at the library, and found a lot of build it yourself stuff in older ARRL handbooks, QST's, etc. my 1st project is a key / electronic keyer. i've spent 3 bucks on it so far. the key is a hacksaw blade based bug-type key. i found a electronic keyer in Orr's (w6sai) 'radio handbook' using a couple 555's and some flip flops. i should have this wire wrapped and ready to go in a day or two.

i saw plans for an 'improved cubic incher' transmitter that i think i'll build next. i haven't thought about a reciever yet, but i'll worry about that when i get to it.

i'll use a dipole or a full wave loop antenna, and i've found plans for SWR/power meters and antenna matchers.

my goal is to get on the air for $60us. i hope i can build a real nice rig like Corporal Carter's on Hogan's Heroes.

i may be a bit goofy, but i'm not goofy enough to try and explain to my wife why i spend 3 semesters of one of the kids college tuition on a new radio.

Yes, what a scam. Gets you to buy their drop in charger at close to $150.

>I wonder if there is an adaptor to charge the battery
>off the radio with the NC-60B.

Not at this time.

>Alternatively, I would like to use the ICOM BC-30 charger I have, but
>there is no adaptor to make the connection.

And very unlikely there will be...

>The Yaesu NC-50 (with CA-14 Charger Sleeve) is the only Yaesu
>alternative I know of.

W & W Associates sells both rapid and trickle drop in chargers for the FT-50.
The MasterCharger Ia rapid charger at $85 and the IIa trickle charger at $39.
They both feature *replacable* pockets ($16) for virtually any handheld.

http://wwassociates.com

Anyhow, I'm in no way connected with them except I just bought the IIa for
my FT-50. I sick and tired of getting screwed every time I change HT's.

Hope this helps,
Sean

972. Low Power Output From Yaesu FT27R

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-18 00:00:00 UTC
From: blackie@gate.net
Message-ID: <4skjji$22so@news.gate.net>
Source record: 197627

Well thanks to some advise from people on this newsgroup I was able to get my Yaesu FT227R back on the air. My rig seems to work fine except for the fact that it only puts out about 3 watts in the high power setting (it is supposed to put out 10). Other hams report that the audio sounds good, and I am able to hit some of the local (close) repeaters with full quieting using a 5/8 wave magnetic mount in the house (yes I have checked the SWR and it is 1.2:1).

What could be causing the lack of performance? Could the PA transistors be getting bad? Is it possible to tweak the rig for better performance? Is it worth sending to Yaesu for tweaking?

Thanks in advance for any help

Craig aka Blackie Lawless

Well perhaps the FCC will convince you:

Subject:
Reverse Autopatch on Amateur Radio repeater systems -Reply
Date:

Thu, 18 Jul 1996 08:39:44 -0400
From:
Bill Cross <BCROSS@fcc.gov>
To:
cboone@earthlink.net, fccinfo@fcc.gov

The ruling has not changed. Those trying to argue that a part of the
call
(the ring etc.) is "telemetry" are trying to find a way around a rule
they
don't like. This e-mail is your writtem confirmation.

William Cross
Private Wireless Division
FCC

>>> Chris Boone <cboone@earthlink.net> 07/17/96 04:37pm >>>(Please forward this to those
responsible for amateur radio service
inquires) In a 1977 issue of QST (not sure what month), a letter that
answered questions about the use of reverse autopatch on amateur
repeater systems was published. This published letter was from (I
believe) John Johnston to the group that had originally inquired. In
the
reply, the FCC's interpretation of Part 97 rules was that NO signal (not
a
ring, tone, etc) could be activated by the reverse patch (either thru
DTMF commands or the line actually ringing) UNLESS a control op had
screened the call off the air FIRST, and there were no exceptions to the
rule.
Is it correct that this ruling has NOT been changed? I am requesting
written confirmation on this. Some people try to justify it by saying the
ring out on the air (or a digital voice announcement) is telemetry...I
feel
this is their way of trying to justify their actions but NOT inline with
Part
97.

I have a Yaesu FT-DX-100 (yes, one hundred) which is missing the power plug.
The receptical on the back is configured like this (male).

```
| | - -
- - - -
| | - -
```

So I need a female to match this.

The array is about 1 inch by 3/4 inch.

What might this be called? Who would sell these?

I also am looking for an operation and/or service manual.

Thanks, Phil ki0dm

The ruling has not changed. Those trying to argue that a part of the call
(the ring etc.) is "telemetry" are trying to find a way around a rule they
don't like. This e-mail is your writtem confirmation.

William Cross
Private Wireless Division
FCC

So much for your telemetry argument...

AS I have stated many times here, NO reverse autopatch may send ANY signal out on the air (Call, ring, carrier, etc) without a CONTROL OP screening the call FIRST OFF THE AIR...

This is the FCC's rule....you dont like it, change it...otherwise, this hobby is starting to head down the same path as 27 Mhz CBers who justify operating freeband "because noone is there" (Yeah?? Tell that to the military and other countries!)

Chris
WB5ITT

Argument closed!

Yup. Here in Texas, we hang anyone attempting to commit suicide. If they have any cattle, we sell 'em to pay for the hangin' party at the local saloon. :-)

From: jshell@washington.xtn.net
Message-ID: <4slvj5$805@news.preferred.com>
Source record: 197638

Can anyone help me figure out how I can get my modem to dial after picking up using a Caller ID blocker? My Radio Shack Caller-ID blocker sends out 3 tones as soon as the line is picked up. These tones apparently screw up the modem altogether because I get a "no dialtone" message after it picks up. I tried entering three commas in the init strings to pause long enough for the modem to hear the dialtone but that doesn't work either. I'm just wondering what could be done so that I don't have to disconnect the call-ID blocker every time I use the modem.

Jeff

lwh@orian.mc.duke.edu (lwh) writes:

Comments about FT-50R sniped

> How does this radio compare with the Ft-51r?

They are two *very* different radios. The FT51r has more features, can receive on two signals at once, and can do crossband repeat. It's like two radios, one box. It has "Spectrascope", scrolling help, backlit keypad..

The FT50 still has many features, but acts more like one radio that can cover either band. Receives only one frequency at a time, does not have the scrolling text help..

It's my opinion that the FT50 is a nice radio. Reasonably priced! I never have received two frequencies at the same time on other dual band HT's I've had, so for this one it's not that important to me. The FT50 seems real durable, although I have not had the chance to prove it. The FT51 looks more fragile to me, but again, no proof, only feel.

From: Tom <tkoliver@telis.org>
Message-ID: <4slm0l$jn4@mentor.telis.org>
Source record: 197643

After reading numerous messages about mods for the Yaesu FT50, It is obvious that there are now only a few avenues available...EZ Clone or ADMS-1C software, and the mods from Bill Childers'(KE6VVW) "(In)Complete Guide to the Yaesu FT-50 Version 1.1". I have a few questions that have not been posed however.

I've performed the xmit mod by removing the solder bridge jumper behind the keypad, but has anyone "discovered" what the other two solder pads do to the FT50 if they are jumpered either one at a time or together?

Is there a source for Macintosh programming software for the FT50? (My guess is NO!)

If there are other sources for the programming cable (RT Systems, EZ Clone, etc.), then there must be a source for the necessary 4-conductor plug. Where?

As to those who have had the PTT cover come off...The radio has a one-year warranty...It's only been out for a few months and should be repaired by Yaesu at no charge.

On 15 Jul 1996 01:47:34 GMT, KMAGLOUGHLIN@delphi.com wrote:

:
:
:Personally, I don't care for Bird wattmeters. This is, of course, if we are
:talking about Bird model 43 or similar. My reason is because the range
:splits are perfectly stupid and make them difficult to use. For example:
:
:Radio on the bench is a 110 watt Micor. What slug do you chose? Do you use
:the 100 watt slug and pin the meter when doing your transmitter alignment or
:instead use the 250 watt slug and deal with less than half scale meter
:deflection?

Uh, where are you from? Most HF units do 100W, some 150, some 200-250W. So
that means most people would only have to use 2 slugs if they owned a high and a
low power HF rig. Besides, noone said you had to run it at 110 watts all the
time.
:
:The same sincero is true with a 250 watt base station. Do you use the 250
:watt slug or the 500 watt version?
:
Yea! An FT-1000 has 200W output I believe, and even some tube rigs that would
do a max of 250W shouldnt be run that high anyway. Most rigs that can hit 250W
are on their _SHORT_ duty cycle anyway.

:It is for this reason I prefer the Telewave portable meter. It comes with
:a 5, 15, 50, 150 and 500 watt range selection. This is in a wide band
:package. I don't have a need to change slugs to gain accuracy as my meter is
:pretty much flat about 100 mhz. Almost everything I do is VHF and above
:except when I have to go to align a six or ten meter base station. (Normally
:a 100 watt or 250 watt Micor base station on 52.525 or 29.6.) When this
:occurs, I just look at the compensation chart and know I am about right.
:
Thats fine- but with the bird you never need a silly chart. Just the appropriate
slug for the job. Accuracy on the bird is better than its published spec, in
most instances!

:The Telewave meter has saved me a bunch in slugs and is one easy to carry
:unit in one piece.
:
:I will say I prefer the Bird Termaline meter for on the bench use. Nice unit
:good for 150 watts in four ranges. Good product.
:
:Kevin KA0JQO
:

:Someone asked me for a breakdown on Mitrek mobiles. I'll do that one in a
:while when more moments are available.

I've never heard of them.

Depends on the serial # of the 811. If it begins with 9N or later, it cannot be modified. If before 9N (for example, 9D, 9F, 9J, etc), there is a mod that will allow TX & RX from approx. 410 to 475. The TX and RX ranges are individually keyboard programmable following a master reset in a modified radio. I programmed my modified 811 to receive from 410 to 475 but to restrict transmit to the 420 - 450 range. That way it's impossible to TX out of band.

Send me your postal mailing address if you would like a copy of the mod.

I have the MFJ 9420 and it is a great little rig. Hot receiver (if not the most selective), built in full time speech processing and 12 watts is quite enough to talk all around the U.S., with good reports. I even snagged a leisurely QSO with a guy in Australia one night. And this is not using a beam. The best antenna I have is a ladder line fed 80 meter inverted vee. I've contacted Canada with a magnetic loop sitting on the ground and talked with California with an Outbacker antenna on the car (from Texas).

The downsides are:
No noise blanker. I can't use the rig in the car with my car running.
The CW conversion works but the QSK is clunky at best since it uses a relay. Best used as semi-QSK. But it works.
There is no RIT which would be nice for CW.

But...for a sideband rig capable of worldwide voice communication powered by a battery. It can't be beat. Despite the MFJ-bashing..it seems like a solid rig.

The "boatanchors" e-mail list was started almost 4 years ago for
the discussion of homebrew and commercial tube ham gear from the
40's and 50's. It grew like crazy to almost 1000 people and really
overloaded the volunteers who were maintaining the list. So it changed
to a subscription format ($12/year) to help pay the costs and currently
has about 500 members. It is a great gang of people - and there are
plenty of ARC-5 fans amongst the group.

There is also a smaller "glowbugs" list (free) strictly related to
homebrew tube gear - one-tube transmitters, regen rcvrs, you name it.

There are also a whole host of World Wide Web sites with info and
pictures of vintage gear.

To get a free trial subscription to "boatanchors" send e-mail to
listproc@theporch.com saying:
subscribe boatanchors your-name-here

To get a free subscription to "glowbugs" send e-mail to
listproc@theporch.com saying:
subscribe glowbugs your-name-here

To start exploring WWW sites (including "boatanchors" archives)
try http://www.mindspring.com/~johnmb/

and stay tuned to the newsgroups - there is a new proposal to
establish rec.radio.amateur.boatanchors as an official newsgroup.

Source record: 197657

I recently purchased a like-new FT-811 and I've been
checking the net for mod information.

I've found several mods for the FT-411 which is a near
twin of the FT-811 (811 is 440 mhz, 411 is 144 mhz),
but no mods specific to the FT-811.

Do you have any experience with this radio?

Some of the FT-411 mods include keyboard extended receive,
changing jumpers for extended xmit, and using software to
transfer memory to a computer via serial cable, bit-twiddle
the file, and then reload to change band plan.

Before I start hacking, i'd appreciate any input on which
is any of these mods are possible for the FT-811.

Thanks,

victor.gregg@bst.bls.com

please don't complain about the return address in this message.

I think your inquiry would elicit more responses if you better defined your needs and limits. A moderate amount to you may be excessive to another Ham. What is the minimum selectivity requirement for CW? Does it make a difference if the radio uses tubes or transistors?

The Yaesu FRG-7 is a SS receiver, uses a band selector that is phase-locked in 1 MHz steps with a smooth tuning VFO in between those steps. It has a built in speaker, can be powered by AC or 6 D type cells or an external 12DC source. The drawback is that it does not provide any filters. The lowest IF is 455 KHz, so you could probably add a Collins filter. I bought mine for general use, not for a primary receiver. I got mine for $150 used several years ago.

Finding a general coverage receiver with good filters for a modest(?) price will be difficult. Finding a Ham band receiver with good filters for a modest price will be much easier.

Regards,
W0MAY

If I were you, I would order the maintenance manual for the rig. It is
unlikely that the PA TXR's are bad. They typically don't go soft like
vacuum tubes, instead they will usually show an abrupt failure.

I will volunteer to create a database (to be converted to a text file)
that will catalogue info for "GOOD" quality versions of various types
of old gear. The price info would be presented as LOW - MEDIAN - HIGH
estimates as provided by hams. I will break it down by manufacturer
and provide as much generic info as possible, e.g., years sold, etc.

If enough are interested, let me know by sending your info about your
favorite rig(s) to me and I will get it started.

send info to boats@k7no.com

All contributors welcome and PLEASE try to be realistic in ur $$
estimates for "GOOD" status.

I've used the Autek RF-1 for eight months. It's been a wonderful tool, but the tuning is the very definition of tedium. The coarse tuning is way, way too coarse. They should have an additional band or (PLEASE, PLEASE) a 5 turn pot. Power draw seems high, making me toggle the power on and off like there wasn't a milliamp hour to spare. If I can fit a 5 turn pot inside later this Summer and arrange for a bigger battery it's going to be perfect.

A few months back I was charged with doing the RS-12 contacts for a Field Day effort. For practice at home I made 10m turnstile and 15m two wavelength loop antennas. The loop required an L network at the feedpoint and the Autek turned this from fantasy to an easy project. It was great to have it hooked up and squeeze and spread the air wound inductors to get the impedance exactly on target.

Another thing that's nice with this little unit is to work out tuner settings without having to transmit any significant power. I can get everything sorted out with a new antenna and have found very good agreement with the tuner settings after switching to the rig.

While on this subject, I accidently lost my "user's manual" for the RF-1. Yes, all 3-4 pages :-) Could somebody remind me of the procedure for determining the characteristic impedance of a line? I currently only know how to do this indirectly and it's very awkward.

(I know, call Autek. It's on the queue.)

1013. TH-78A parts, service?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-18 00:00:00 UTC
From: Mark Eichin <eichin@cygnus.com>
Message-ID: <xe17ms2yxdw.fsf@maneki-neko.cygnus.com>
Source record: 197697

I've had a TH-78A for years, and now, after much abuse, the metal back of the case has cracked right around the antenna mount. The entire back of the case is one piece of metal, and I'd like to just replace that (I've dismantled the whole thing before, to resolder the antenna connection :-) so the mechanics are no problem.) I'm not sure of the composition of the metal, nor am I up to welding it, though I could look into that if I have to. (crazy glue doesn't conduct electricity...)

Does anyone here have suggestions? (or better yet, a burned out th78a that I could scavenge for parts?) Does Kenwood Service sell parts like this directly, or do I have to go through a dealer?

I checked out the www.kenwood.net site, and they have cool stuff about the TH-79A(D)) but *nothing* about service, that I could find anyway...

1015. Re:FT-50R - A good lesson for Don

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-18 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <4sjvdv$2ec0@mule2.mindspring.com>
Source record: 197699

I have made numerous postings about the FT-50R, including a couple when I was frustrated with problems involving the FTT-12 and voice messaging. I won't waste time by repeating those here. Most of the info was observed facts, but with a little emotion thrown in.

I have been told that someone in marketing fom Kenwood has taken the "liberty" of sending copies of my post to amateur dealers around the country. I suppose this is their right to do with public information, but I feel it is not very appropriate. I have stated the following in other posts, but in summary:

I DO the wish features re: voice messaging described in the manual worked as described, and yes...I do have a use for them.

If I had the opportunity to return the radio (or keypad) to my dealer for a refund, I would NOT. I still like the radio enough to say it was well worth the price.

Given Kenwood's marketing plan and disregard for the future of amateur radio (in my opinion), I am SURE my next radio will NOT be a Kenwood.

Perhaps Kenwood would like to circulate this post to all of their dealers.

The lesson for Don - post in haste, repent in leisure. And no... no one asked my to say this.

regards, Don (KE4KYO)

NiCd lifetime should be quite a bit more. However, using the wrong
charging design might even make it worse. (I doubt if Motorola could
err on that though.)

>The radios were Motorola Visars, and they were used by a city government,
>with high duty cycles, and no attention paid to running batteries down
>prior to recharging, etc.

Shouldn't need running down on both design. May be once in a few
months on NiCds. Some "smart" chargers in the past did run them down
for exercising, during the high time of "memory effect" myth and found
them work well. Later of course we know about voltage depletion, and
just happen the exercising cycle works for that too.

>I believe the "memory" effect of NiCads has been eliminated with newer
>cells. We have NiCad batteries for our GP-300 portables at work that get
>charged whenever we're not running calls (ambulance company) on rapid
>chargers, and the original batteries that came with the radios are still
>performing fine after 3-4 years (!!).

Should be. NiCd is often rated for 3000 cycles, full cycle and ideal.

>NiMH batteries also suffer from a fast self-discharge rate. If you don't
>use and charge the battery on an almost daily basis, they become quite
>inconvenient. Most NiMH cells lose their charge at a rate of about 10%
>per day.

Should be about 5%, compared to 2% of NiCd. Nothing can top Li-ion in
this.

>Your milage may vary...

True, generally usage, NiCd is better. For those who absolutely need
highest capacity, lowest weight and size, fast charging (which takes
out Li-ion), NiMH has its place, as shown in laptop computers and

cellular phones. I personally am willing to pay for high quality NiMH
or Li-ion for my handheld transceiver to save some weight and size.

Yes I remember those days very well! My first receiver was part of rx/tx combo - the BC-474A trunk-like radio that was water-tight - that I somehow blew out all the filaments. After that I got my first ARC-5 rx that tuned 3-6MHz. I used an insulated wire that I poked down inside one of the IF cans and tuned a regular BC band radio to 1415KHz (or thereabouts) for a multi-conversion radio.

I also used my ARC-5 tx as a novice (with VFO) with well regulated supplies and kept the unit on 24 hrs-a-day to prevent drifting.

Moved it all into the car as a mobile and had great times there too. Ran DSB-SC in the early days of SSB and it worked great! I loved those days and hardly ever came out of the basement.

Too bad there is not the same level of tinkering today by the young folks cuz the lack of REAL commitment to learning and experimenting will be the nail-in-the-coffin for this hobby.

Hi Dick, please don't blame the "young folks". Here's my take on what's happening. In the '60s, I was a digital design expert using discrete components. I am no longer a digital design expert because I don't know how to design chips. My 10 component flip-flop is obsolete. If you will think about it, I believe you will conclude that the design knowledge and tools that you remember so fondly are obsolete because we and the "young folks" cannot compete with the chip designers. It doesn't make sense to design and build an expensive, obsolete 6 tube receiver when you can buy a chip that does the job better.

The "young folks" here at Intel are so much more knowledgable than I was at their age that it is scarey.

Hello all:

Here it is... where I eat crow! Chris is absolutely correct! A reverse autopatch MUST be screened OFF-THE-AIR... not even a simple beep or ring is allowed to be transmitted by a repeater if it is initiated by an unlicensed caller (a 3rd party). Chris and I both got email confirmation of this issue from Bill Cross at the FCC Private Wireless Division.

I would suppose that if *ONLY* licensed hams were to use a reverse patch that it would be okay, but that is really not a practical situation either as your system could still be plagued with "illegal wrong numbers!" Besides that, a ham could just USE A RADIO to call someone on a repeater! Best to leave the reverse autopatch feature disabled unless the FCC further relaxes the rules. Or unless you can keep an operator standing by at the repeater site to screen all calls before putting them on-the-air!

Thanks also to a couple of other folks who confirmed Chris' view with emails to me over the past few days.

BTW Dirk, AX.25 is the digital protocol commonly known as "packet radio." X.25 is the original (since about 1976), and AX.25 is AMATEUR X.25. But I have no idea what the variations from the original might be, if any...

Vy 73 all...

:a real mobile phone service.
:
Yes- but those of us who got really sick and tired of getting the cellphone cloned 10 times in a row by some phreak(which is just as much of a headach as paying the bill) sure think that using your own patch to make routine, non business calls to people you know, think its a godsend. I sure do. I feel that anyone who has the capability to use an autopatch without hogging mainstream machine traffic should use it. The machines are pretty damn quiet around here during the day- all the more reason to use them, to prevent the FCC from being able to say that we dont use the frequencies we have.

From: husterty@ucunix.san.uc.edu
Message-ID: <4sk2ve$5qf@babbage.ece.uc.edu>
Source record: 197713

The FNB-41 is 9.6V, 650mAH and appears to be twice as "thick" as the
FNB-40. The FNB-41 has the belt clip and slot for the lanyard.
The FNB-42 battery is 9.6V, 1100mAH and has a 'bulge' in the middle of
it, making the radio/battery combination a handful. The FNB-42 doesn't
have the belt clip or the lanyard attachment slot.

Source record: 197714

The FT-51 is a dual-band transceiver with dual in-band receive capability.
The FT-51 also has the "Spectrum Analyzer".
The FT-51 costs a bit more than the FT-50.
The FT-50 is about 3.5 inches tall, not including the rubber duck, which is
smaller than the FT-51
The FT-50 has Dual-Watch Receive capability, kind of like a versatile
Priority watch, even though it has Priority monitoring also.
The FT-50 has receive capability from 76MHz to 1000MHz.
The FT-50 is priced in the $330 range.

>then... Ciao!
Don't worry from that standpoint (in so far as I am concerned). I am a
former 11 meter op who got out of that bad news almost 4 years ago. I
know the feeling when it comes to CB. Too many "bucket mouths" and not
enough common sense. The most unfortunate point of all this is that
the nitwits are generally the most vocal.

You say not to "drive the audio" so much. Well the majority of HT's can't be heard over the road noise in a car, or the ambient noise on a busy street. This is the first HT I've had that I can hear at a REASONABLE sound level without hearing distortion in the SPEAKER. I'm not talking about over deviating on the transmit audio - but the audio amplifier for the internal speaker - what I hear. That certainly does not cause over deviation on transmit audio.

In regards to the size - there will always be a limiting factor in reducing the size of an HT or any other device for that matter. It's the human interface. This radio is still large enough to operate without a microscope. You can keep your boat anchor HT's. I just refuse to pack them. The radio is FAR from perfect - I read about all the defects before I purchased. It meets a need as a portable - secondary radio. It's especially nice for monitoring the Skywarn activity - as I live in tornado alley. Because of the size there is a greater chance that I'll actually have the radio with me when the weather is bad. It does not replace a high power mobile radio for the car. For that type of use it would definitely be a compromise.

If you think I'm defending the radio - read another thread in this newsgroup that I wrote about how my PTT button came off. I'm not one sided for Yaesu. This is the first Yaesu radio I've purchased. Yes I'm disappointed with the problems. A "mil-spec" radio should be tougher that that - period! No excuses. Yet I still like the radio and anticipate it's return.

The plug you're describing is known as a "Jones" plug. Newark Electronics used to carry them. Be careful, though. The US plugs I got for a FT-100B were numbered differently from the Japanese. The US numbers went from left to right while the Japanese plug was numbered from right to left! Good Luck.

Trying to remain objective in the matter I can see your point- ethically it
may be wrong...but...consider this, if when a call comes in OR better yet
when my repeater controller senses an "E" from e/m signalling used from a
microwave link, why can't it inform me, over the air, " there is activity on
the phone line " ???
Agreeing with Gary, I would have to say this is no different than
the rpt notifing you of a door open alarm, or for that matter a power
failure caused by someone at the site "pulling the plug" . Now if this
person entering the room/pulling the plug is a not licensed, wouldn't it be
illegal to transmit such "telemetry"? If this is legal then the "telemetry"
notifiing me of activity on the phone link could also be made to be... It
still boils down to interpratation & intent.
I actually wouldn't consider it, but had to comment.

If two whimsical comments by two individuals is sufficient to change
your mind about amateur radio as a hobby, I agree that you will
probably not be well suited to it. Perhaps take up something like
stamp collecting, where you won't need to learn how to interact with
other human beings, even [horror!] those who don't agree with you.

: That's about it. There is no magic wand for receiving distant UHF
: signals. You just need a high gain antenna mounted as high and in
: the clear as possible, and a mast mounted preamp to overcome the
: feedline losses to the set.

: Gary

You'll get a slight improvement using RG-6 coax rather than the common
RG-59. 75-ohm hardline (often available for free from cable TV companies)
would be even better, but probably not worth the trouble.

Good luck,

>mentioned. Could you give me some rather specific help on how to go
>about this (how many turns, which direction, etc.)? Tnx for your
>help.
>
>Bill KF2ON

Here's the procedure given in the service manual.

1) Tune radio to 14.100 MHz
2) Set mode to USB
3) Turn NB off (M3)
4) Preamp ON
5) Set R126 to the center of its rotation
6) Connect a signal generator to ANT-1
7) Tune the signal generator to 14.1015 MHz
8) Set its output level to -82 dbm
9) Connect an oscilloscope to CP2
10) Adjust L61 and L64 for maximum voltage on the scope
11) Set NB ON
12 Adjust R126 until the noise (seen on the scope) just reduces

Here's an ASCII pix of where the points mentioned are in the lower
left corner of the main board.

```
|
|
_ _| L61 CP2
| R126 L63 L64
|
| Cable LL LL LL
|__________________________
FRONT
^ board edge
```

Don't touch L63, it's the wideband FM discriminator adjustment.
R126 is a single turn pot. The correct adjustment should be about
an 1/8th of a turn past center.

Gary

If you don't smoke, you might consider removing the ash tray assembly and installing the TM-742A's control panel there. Mount the main chassis on the rear cab wall behind the driver's seat. As soon as I can find enough time, I plan to do just that in my 1994 Ranger, except that the rig in my case is an Alinco DX-70T hf transceiver.

Yes, I've noticed the SB-303's audio is a bit lacking in bass response,
but not to a point where it's objectionable. What I hate about the
SB-303 (and all Heath SB-series receivers and transceivers) is the CW
pitch at 1000 Hz. I plan to re-crystal mine to give a 750 Hz pitch,
like most modern HF rigs have. 1000 Hz is just too hard to listen to
(for me, at least, YMMV).

He's talking about *speaker* audio. These two rigs (50 and 51) have
better audio output than most of the tiny radios. And that's important
if you're trying to hear them in a noisy location. My little C508A has
clean audio, but not very much of it. In a noisy truck, or a car with
the windows down at highway speed, you have to hold it against your ear
to understand it. (Of course I have a *real* radio in the truck so this
is a moot point for me, but it would matter to someone trying to use
a handi-scratchie as an all purpose radio.)

No need to keep the reverse patch disabled. Once again - reverse patches
are legal. Your concept of keeping the reverse patch avaible to hams
only is a proper concept. No reverse patch should be set up so that it
rings just because the phone line is ringing - you reaaly don;t know
what you are going to be answering. Every reverse patch I have ever been
invlovled with requires the caller to use a code/command before ANY
signal goes out on the air.

Yes. Usually a ham COULD JUST USE A RADIO to reach someone. But you can
use your reverse patch to reach someone when you are out of range of such
repeater or don't have a radio with you.

I was president of a small club in northern California a couple of years
ago. During that term I spent some time working in Nigeria. I used the
reverse patch every week to "check-in" and say hello to members during
our weekly 2M net.

The best way for hams (that are too cheap to get a cell phone for making
mobile phone calls) to get incoming messages would be be to get a pager.
When you get paged (on a non-amateur system) you can call on the patch
if you are so inclined.

|>

I'm just wondering, but since a BBS is automatically answered by a computer and presumeably authentication is done via a login and password prompt, what possible reason is there to need or want the Caller-ID function?

I cannot imagine you sitting at the console and acting as a traffic cop allowing or disallowing access to the BBS according to the display. And since you state that your BBS rejects the blocked calls this would imply that the capacity exists for computer collection of the information.

I as an advocate of privacy issues, would then point out that this is precisely the reason that I have my number blocked.

I have done quite a bit of work towards removing my name from mailing lists, telemarketing databases, scam lists, and otherwise annoying and unwanted places that waste my time by contacting me. I do not want to automatically be included in some sort of database simply because I made a "Shopping by phone" call. I feel that the collection of personal data of individuals by special interests, whatever they may be, is already far too pervasive. To me this is actually obscenely disgusting.

Now I certainly do respect your decision and your right (and Arden's) to not accept blocked calls. And I can see why a private individual might do so for the same reasons I have mine blocked, the right to choose is going take up your time via the phone.

But... I take the other side of the coin and encourage others to not do business or otherwise deal with persons or individuals that won't accept blocked calls. If a company won't accept my blocked call then it simply does not need my dollars that badly and I will take them somewhere else.

Jim

1054. KAWIN NEWS - Introducing KaWin Lite!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-19 00:00:00 UTC
From: stan@mutadv.com
Message-ID: <4sofpl$1kc@news-2.csn.net>
Source record: 197439
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.equipment

KAWIN NEWS - Introducing KaWin Lite!

KaWin 6.40 is ready for download! Corresponding changes to the help file too. KaWin 6.40's enhancements are directed toward Kpc-3 owners.

The Kpc-3 is a great little TNC for VHF packet with all the benefits of Kantronics Host Mode and more, but it offers neither simultaneous multi-port port operation, nor HF digital modes. Thus, Kpc-3 users only have access to the tip of the KaWin iceberg!

For these users, there is now KaWin Lite registration!

KaWin Lite registration is a special opportunity for owners of the Kantronics Kpc-3 or other Kantronics single port TNCs. With KaWin Lite registration you enjoy all the features and benefits of the full KaWin program, with a very simple limitation:

KaWin Lite registration is ONLY valid when used with one, single-port, Kantronics TNC - such as a Kpc-3. KaWin Lite registration fee is just US$39.

KaWin Lite is NOT a separate program. KaWin Lite registered users use exactly the same KaWin (version 6.40) program, but the KaWin Lite registration will turn off that ugly nag meter just like the full registration as long as these simple conditions are met:

1) Only one TNC is defined in Option/TNCs&Radios,

2) That TNC is the first TNC in the list (TNC 1), and

3) That TNC is configured as type, "All single port".

If you comply with those three simple rules you can enjoy the benefits of KaWin registration at a bargain price. But remember, whenever any of those three conditions are NOT met, KaWin will behave as an unregistered program.

Registered users with KaWin Lite registration who upgrade their systems to a Kam or other dual-port TNC, or who add additional TNCs may upgrade their KaWin Lite registration at any time through a KaWin Upgrade registration.

To add to the KaWin News mailing list, send email to
stan@mutadv.com with the word SUBSCRIBE in the subject line,
or use the handy subscription link on the KaWin Home Page.
To be removed from the list, send email to stan@mutadv.com
with the word UNSUBSCRIBE in the subject line and be sure to
include the email address this message was sent to in the
body. I cannot remove you if I don't know your address!

If someone is looking for a real low cost way to trickle charge these batteries on or off the radio, why not buy one or two of the charging cups (Either Yaesu's or W&W's) and hook it up to a small constant current source. At some point, if you got real ambitious you could even build a quick charger!

I was just thinking about what makes a drop-in charger difficult to homebrew. It would seem to me the most difficult part is the drop in cup with the connectors in the right spot for the battery terminals. Well, W&W and Yaesu now sell these charger cups seperate from their chargers. Having this taken care of opens up the possibilities for building the rest!

I have not done this for my FT50R (wife got me the Yaesu charger for a gift), but I did for a Icom 2SAT and 24AT I once had. Worked great. The cup (an off brand at the time) was about $5, current source was a couple of bucks in parts, and I used an old wall cube I had laying around to power it.

Just an idea!

>
>

And didn't they fry easily! The leads parted company easily, too...I built quite a few little things with these (and wasn't the NPN version a CK-721?), 1N21's, later on 2N107's, etc. Even got one to work as a teeny QRP rig with a 3.5 xtal and half of a rabbit ear on a banana plug in a little black-wrinkle Bud box (steel then, no less); took me two nights to file out the holes in the box from 1/4" hand-drilled holes; wish I could find the sucker. Many of my old circuit ideas came from Popular Electronics, a guy named Forrest, I believe. But even back then, I still liked the tubes better. Remember "Timothy twerp was quite dumbfounded... when what he thought was, wasn't grounded...one might say he was quite transfixed...with his thumb on pin three of a live 6L6!"? It took even longer to file out the holes for tube sockets...

I still have a bunch of CK-722's and babyfood jars full of gemainium diodes with ceramic bodies, leads shortened from being used numberless times...

I was just a little kid when I began reading about and cannabalizing/homebrewing/converting old stuff into neat things that worked, even if crude, more often than not. Finding nearly free transformers and 807's, I built a 500w linear with a dozen of them as finals in PP/parallel, using only info gleaned from old ARRL books (they were at the city library, a 10 cent bus ride away) and a tube manual. I was 11. The neighborhood teevees were never safe until I went to bed! I remember the basement lights dimming when I keyed it, and sometimes seeing a faint corona on my longwire lead-in on foggy nights (heh-heh).

Used to get my fishing worms by cranking an old 5-magnet telephone generator into 2 coathangers stuck in wet ground; sold the worms to my buddies to buy more parts or magazines, mowed lawns, shovelled snow for same; never worried kids might think I was weird, either; I think all us kids were both more individualistic and enterprising than today, and maybe had more fun as well. This was before RS opened in the area (not until 1960, with their relatively chintzy components), and there were real parts distributors who gave kids like us "experimenter" accounts, and delighted

in seeing us walk in (as long as we kept our hands in view...).

We designed/built R/C planes, too. One or two-tube rcvr, escapement relays, and 90v B batts required wingspans to 6' and lots of balsa/silk/'plane dope. Sometimes, they would fail to respond and just fly off into nowhere. Got some of them to drop real bombs, using spare glowplugs as igniters and sticking cherry bomb fuses into them.

It was amazing the legnths hams and hobbyists would go to corroborate and help each other have fun. A ham friend my age once took me to the home of a ham who was a total quadrapelegic. He lay in a mechanical chair that rocked him a full swing every few minutes (for circulation or lung fluid?), smoked Pall Malls via a plastic tube/mouthpiece to a large coffee can as ashtray, and could only move his head and 1 toe on his right foot. One whole wall of his room was floor-to-ceiling racked equipment, which buddies had cheaply and ingeniously configured to be controlled entirely by telephone-type latching relays via servomotors and belts to knobs, all determined by the combination of three pushbuttons at his useable toe. We went over to tweak up things, about '62; I remember a lot of Collins and Hammarlund gear with sheaves on the knob shafts. ARC-5's/BC-348's, too. These latter were always available from our local radio shop for under $10; the mods we did to them are numberless, mostly from QST articles.

IMHO, we have lost a great deal of adventure, not to mention freedom. I am thinking of getting relicensed and doing 80m AM phone again.

>make sense to design and build an expensive, obsolete 6 tube receiver
>when you can buy a chip that does the job better.

With all due respect, I do not think this is true, in the context of enjoying/learning/innovating/bootstrapping in the hobby. The stuff I was homebrewing in the '50's was, too, quite obsolete (by that definition) when I built it, by 15 - 20 years. New gear then was relatively just as expensive, if not more so, than today, no? In my early years, I seldom got to SEE a Collins or a Hammarlund. When the SP600 came out, it cost as much as a modest house or good car.

I cannot buy a chip that will give me the historical experience, hours of arcane befuddlement/pleasure/satisfaction, challenge, or re-use of available materials which all that activity brought.

1059. What's good Equip. for me?

I have the COMP-100.... Also the Maunual... It Has been on Constandly
now since 1985....
I got my manual FRom RADIO SHACK... Your RADIO SHACK dealer can ORDER
it For you...CAT.NO 20-110
It is 12 pages long

I am in Flint, Mi
E-mail me if you would like the info on programming this scanner

The manual is copyable.. You will never be able to program it unless
you have the manual....

While reading article <4sojuf$288@murrow.corp.sgi.com>, I noticed that
jimf@zoinks.corp.sgi.com (Jim Fellows) said the following:
>I'm just wondering, but since a BBS is automatically answered by a computer and
>presumeably authentication is done via a login and password prompt, what
>possible reason is there to need or want the Caller-ID function?

The obvious answer is that many BBSs use it as an additional form of ID. For
example, I can steal/crack your username/password, but it's not quite as easy
for me to arrange to come into the system from what is your phone number
according to CID.

Alternatively, if you just want to discourage mischief, simply logging CID may
be able to tell you where cracking attempts are coming from unless the cracker
is smart enough to call from a pay phone.

>I cannot imagine you sitting at the console and acting as a traffic cop allowing
>or disallowing access to the BBS according to the display. And since you state
>that your BBS rejects the blocked calls this would imply that the capacity
>exists for computer collection of the information.

Most popular BBS software now has the capability to read CID information that
your modem may provide. Depending on how you decide to set it up, you can do
login/CID matching or just log CID info for callers. People who block CID
aren't let in.

>I have done quite a bit of work towards removing my name from mailing lists,
>telemarketing databases, scam lists, and otherwise annoying and unwanted places
>that waste my time by contacting me. I do not want to automatically be included
>in some sort of database simply because I made a "Shopping by phone" call. I
>feel that the collection of personal data of individuals by special interests,
>whatever they may be, is already far too pervasive. To me this is actually
>obscenely disgusting.

I'm sure you're smart enough to not call any 800 numbers except from a pay
phone or work, then. Remember that businesses with 800 numbers get a detailed
listing each month of exactly who called them, and if they have real time ANI
service, real time NON-BLOCKABLE caller ID. (They're paying for the call, they
have the right to know who's calling.)

>But... I take the other side of the coin and encourage others to not do
>business or otherwise deal with persons or individuals that won't accept blocked
>calls. If a company won't accept my blocked call then it simply does not need
>my dollars that badly and I will take them somewhere else.

If I ran a BBS my response would be "If you need the information my service
provides, you've likely already given me your name/address/phone number; if you
really want to get in, dialing *82 before you call shouldn't be too much of a

pain."

>

While I feel that privacy is a privilege to be valued, I would not expect to walk up to some stranger's home and say, "Hi, mind if I come and look around awhile?" That is approximately what happens when you ask for access to a BBS. It is the sysop's right to know who is getting access to his system. It is also the caller's choice to comply or hang up. Prior to caller-id capable modems, it was also the caller's option to falsify the information given by the caller. Now, at least the sysop can verify the number used by the caller. I personally cannot remember ever registering as a user of a privately owned BBS without filling out the questionnaire about myself. This has always included my name, address, and phone number. Usually other things were asked regarding hobbies, PC equipment type, etc. It was, and is, my choice whether or not to provide that information.

Accordingly, since the sysop already has my number, I cannot really object to their documenting that additional calls from me are made from the same number. The only time the sysop would probably care to look in the caller log to check the number was if the person calling abused the privileges granted to the user.

In addition, many people use script files to login on their favorite BBS's. This makes the security of their passwords suspect, particularly in the case of laptops. Should someone gain the name and password to an account not their

own, it would be risky to use them. If the user reports to the sysop that the account is in jeopardy, the sysop would certainly be alerted to check the source of any calls using that account.

As to advising your associates to avoid BBS's that want to know the number of the caller, I think you will find that you will be left with very few from which to select (BBS's, not friends).

There also may be some liability in publicly posting a private legal communication, I don't know. But I do know that spraying the net (8 newsgroups?) with your private gripe is kind of obnoxious and seems intended to intimidate your "opponent". If you wanted opinions from the group(s) about the original complaint, you should have discussed it with us legitimately. You may be a bit casual with your use of mass communication, and you may have also added to your difficulties by posting this way.

Be leagal. Go to Radio Shack and get one of those paging systems (they were
on sale) that operater on the CB band hookup a CB amplifier and CB beam (moon
something or other). Then you won't bother your fellow hams on 2m
with anoying tones. No license required.

Uh, well, I'm not an OLD TIMER but I try to appreciate our history...

>Does anyone remember a
>"cat's whisker",

A springy wire which touches a crystal to make a detector. A key part
of the simplest home-made radios for AM broadcast.

>a CK-722

An early germanium transistor by Raytheon. Low performance and fragile
but the first affordable transistor for experimenters. Unusual oval
package with the middle lead off center. Today, excellent silicon
transistors cost less than capacitors.

>a 6L6

A beam tetrode vacuum tube (metal envelope) for audio output. Less
distortion and better sound than power pentodes. In addition to
modulators, some were pressed into service at RF. A glass-envelope
version is still produced and can be purchased in music stores.

> a 1N21

A point-contact diode used for early microwave detectors, especially
radar sets. Consists of a cat's whisker and a crystal inside of a
cartridge which looks like ammo. The suffix letter advanced as more
sensitive units became available over years of production. Obsolete.

> a J-38

A straight key, U. S. military surplus and once the most popular
among hams. Not a shiny showpiece like the Bencher, but good for
serious use. Claims of 30 WPM top speed have been made.

> a geranium [sp] diode

Some types were doped junction power diodes for rectifiers. Those
are now obsolete. The better known detector types consist of cat's
whisker and crystal in a glass bead. Then and now they are used for
AM radio detectors and test instruments such as SWR indicators. New
crystal radio kits often have one of these for reliable operation.

> a 35Z5

An octal-based rectifier tube used in five-tube AM broadcast radios,
the first affordable superhet receivers. The high voltage heaters
connected in series across the 110 volt supply, which could be AC or DC.

Due to the legacy of Edison, some communities had DC supply for lighting.

> a 12SN7

A dual-triode vacuum tube with octal base. Although intended for audio and switching, they also oscillated readily at VHF so hams used them for that. Still sold today in some expensive audiophile gear because they look more impressive than miniature tubes.

> an ARC-5 ?

A military surplus command set radio, to be adapted or used for parts. Symbolic of the post-war military influence on ham radio in general. Many new hams first learned of radios and electronics during WW2, then brought a taste for military-style gear and operation into the ham culture.

Arden,
I know this comment doesn't necessarily fit why someone at home would
want caller ID blocking, I'll answer this as it pertains to a repeater unit
since I see you're a ham. I have a repeater and have blocked caller ID so
that people won't receive the phone number and mess up the controller by
punching in codes and changing the repeater characteristics or worse yet,
changing a function to make it illegal (ie. turning the ID feature off). I
know that doesn't apply to the general population, but if someone were to
use my autopatch to reach you, you'd never pick up the call.

It is unfortunate that your initial exposure to Hams has been negative.
The fact is that you are dealing with people and some aren't so nice. I
was first licensed in 1952. It seems to me that Hams at that time were
more helpful, courteous and well mannered. Yes, there were isolated cases
of jerks on the air then. I have noticed, however, that the number of
jerks on the air have increased over the years. There is always the
option that you don't have to associate with them. There are plenty of
Hams with white hats left. Ham radio has several areas of interest other
than just communicating on the radio. My primary interest in the hobby
was and still is designing and building equipment. I do very little
operating. You need to sort out what area of the hobby interests you and
consider if it offers enough to put up with a few bad apples.

Regards,
W0MAY

I'd suggest "old newspapers" rather than a towel. Some theifs might think that the towel, in and of itself, would be worth the effort. (Remember that they were breaking into cars to steal those stuffed Garfield cats some years ago.) If you're that paranoid, be lazy about things like washing the car and have some various "trash" in it too (like bags from McDonalds) - the potential thiefs will think "gee - there must not be anything in all that trash worth stealing".

This reminds me of two amusing tales:

Some years ago, in a big city there was a garbage strike during the Christmas season. One creative fellow wrapped his garbage as a big Christmas present, put it in the back of his pickup, and parked said truck at a shopping mall for half an hour or so. When he came out, his garbage was gone. :-)

I recall hearing that the police in Dallas wanted to set up a "sting" operation, so they put a new TV (still in the box) into the back seat of an unlocked sedan, and parked it in s shopping center parking lot. They then hid in an unmarked van parked nearby. They gave up after nobody had tried to take the TV, but several people had come by and locked the car.

(If anyone wants to hear a related, amusing "dead cat" story, let me know. :-)

73,
Clark

Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels Pl _AND_ DPL, Keypad programmable, dual VFO, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (Can't find this in the manual, I think it;s a hidden trick.) Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $375/BO. Must sell ASAP, make an offer.

Why do you need a caller-ID blocker? What have you got to hide? I
don't accept blocked calls and I encourage others to do the same.

Jeff, There is an outfit called Pan-Axis Productions in California that sells low power FM transmitters both as kits and assembled. They run any where from a few milliwatts up to 10 watts stereo or mono depending on the model. You can contact them at Pan-Com International, PO Box 130, Paradise, CA 95967-0130. Tel. 916 534-0417.

Good luck,

> would work as a rectifier. Good luck and have fun.
> Regards,
> Rolf
As I recall, I made one of these about 1960, at the tender age of 11. I had lost my lump of Galena and figured there had to be something else, and after playing around with various pieces of junk metal I found an old blue blade down in the basement. All of the bathrooms in the house had the medicine cabinets placed vertically over each other and had a 'razor disposal' slit in the back. Push the old blade through and it fell to the basement, where someone was supposed to clean them up. Turns out the wall was boarded up and there were about a hundred back there. Anyway, I never had to use a pencil carbon since my cats' whisker did just fine, but then again I lived in Park Ridge, Ill. about 3 miles away from 50KW WJJD. I could pick up other stations but I could always hear WJJD in the background. Back then they played rock and roll and I wasn't into it yet. The tuning coil was a simple toilet paper roll wound with about 26 gauge wire and sanded on top, with a slider for an inductive tuner. It worked pretty good and with a wire strung on the roof and ground to a steam radiator I could even drive a speaker to an audible volume, but only with the station I liked the least, WJJD. 50KW goes a long way. I tried some transistors like CK722, 2N107, 2N170, but at the price in those days my dad really winced when I blew one. I think they must have been something like a half a days pay back then. As for graphite being a conductor, I found out the hard way, having a neon sign transformer and trying to build a Tesla coil. I tried to push a hot wire with a pencil a got a major (15KV) surprise, and a lot more respect for excess electrons.

Parting note, anybody remember a book leaf capacitor, where you would tin foil alternate pages to electrodes and vary the capacitance by opening and closing the book? This would really baffle most of the younger set, building a radio with zero trips to Radio Shack, the chain that ruined roll your own experimenting. It was nice in the late 50s early 60s living around so many surplus stores.
Rattle mode off, first post so I got enthusiastic.

I remember those, and I think it had to be specifically a Gillette blue blade, double edged. I built one and I don't remember anything about the razor blade being the speaker element, I had to use WWII headsets like everyone else. As I recall it was about equal to a Galena detector or a 1N34A.
My 2 cents.

dara@physics.att.com (Shel Darack) wrote:
"Sure do. ARC-5's on 40 and 80 were my first receivers. I used them
in my college dorm room to copy 1AW code practice."

(Or maybe he didn't, in which case I don't know who said it
originally).

Actually, the Command Sets aren't that old. By the time they
were available in surplus, post WWII, the radio waves had
long become too crowded to allow calls without a prefix that
denoted the country. Ie, you wouldn't have heard "1AW" on
a Command Set, but you would have heard W1AW. Without the leading
"W", who could tell whether you were 1AW in the US or in Tibet?

Interestingly, we are getting on the verge of having old-timers that
would not have had any first hand knowledge of Command Sets.
Of course, it depends on the definition of "old timer", but if
you use 20 years as the definition (isn't that the requirement
for the ARRL's Old Timer's Club?), with each passing year you're
more likely to get a puzzled look when you mention Command Sets
to Old Timers. I knew about them when I was licensed because
in 1972 because I ended up with a good collection of back issues
of CQ, which covered the surplus scene well in the sixties.
WIthout those, I'm not completely sure what knowledge I'd have
of Command Sets. I know that the local surplus store did get
in a shipment of Command Set transmitters in late '72 or early
'73, and I bought one then. I still have parts of it around.

Hi Cecil !

Tnx for the reply - I agree totally with what you say. Really, we had the best of opportunities in that there was LOTS of INEXPENSIVE surplus stuff available that just begged to be modified and used "on-the-air".

Today most of the rf stuff is so specialized and EXPENSIVE and such a small percentage of the surplus material available that in not mostly a power-supply for a computer or some-such item that is not too useful in rf work.

I'm now looking for some old collins 75S and 32S gear that I can get reasonably cheap to modify for 6-meters. I need some stuff I can easily maintain and modify to provide the performance I require as opposed to an IC-551D, etc that is markedly harder to keep alive!

All of my rf experience has led me the "care-and-feeding" of mfg'g the hp-894xxA series of vector/scalar spectrum analyzers as a pdn-engr here at hp.

Great fun!

>DE KB0WOB in Denver, CO

I owned a TS-130S for several years back in the early 1980s. I used it as my base and mobile rig. Never had ANY problems with it. Performance was on a par with virtually any other rig of that time period. I liked the rig so much that I actually bought my old rig back many years later and put it back into dedicated mobile service for another couple of years, and ultimately replaced it with a new Alinco DX-70T. The only problem I've heard of (and it's been a while) was Kenwood had soldering problems with the PA transistors. The emitter leads would heat up and break free from the solder plane, causing no RF output. The cure, of course, was to take the rig apart and properly solder the transistor leads. Given the age of the TS-130S, I doubt there are still any around that haven't been fixed. So... overall, I would recommend a TS-130S if you have enough space in your vehicle for it.

From: jochen@copland.udel.edu
Message-ID: <4soejr$pcm@copland.udel.edu>
Source record: 197483

Does anyone out there know if there is any way to get the 706 to transmit
with full power above 148MHz? The particular frequencies I need are
148.01 - 148.65MHz (actually, there's another one down at 142.275, too).
I've removed diode D59 which allows me to transmit there, but I notice that
my TX power is negligable (as per the power meter on the 706 itself).
Any info anyone can provide would be GREATLY appreciated (you would earn
a special place in my heart and my deepest respect.)
;-)

73,
-mike

Me, too. I resent having to pay for what should be the broadest possible cross-section of interested parties, not a few elitists that revel in their exclusivity.

Or something like that.

Besides, what's the value of a subscription list server whose for-sale items are always sold before you get the digest, or even without the digest delay, before you can respond to an individual email?

And how useful is a call for information if a potential respondee isn't a member and can't respond?

Or how good does it feel to be yelled at by a list processor with a narrow frame of mind and ridiculous ideas about what is and isn't "appropriate" for discussion?

Makes no sense to me. Let's democratize the process. I can't wait to vote, either.

Other than the above, love those Boatanchor Archives!

I'm rolling over in laughter and great memories....

I still remember when I was a young kid in the mid-fifties riding with one of my mentors, Ben Hall, W9OVL, from Indiana up to Chicago for a 6 Mtr Club of Chicago meeting... old Ben had a Vee antenna for 6 Meters on a 5 foot pole mounted to his back bumper.... and being an older gentleman, always drove about 10 miles slower than the speed limit! That was when radar was just starting to be used (or rumored) to check for speeders.... Ben had at least 20 cars following him all the way to Chicago, not willing to pass, because they thought he had one of those new "radar" devices.... I love it!

A local surplus store has available several lab-type HP SWR meters. They are in old- style instrument cases like some VTVMs and signal generators they also have. I see that the input is a single BNC; I was wondering how would you measure SWR with one of these beasts? The meters I've seen are inline, the RF must go through the meter to measure it. I wonder if these meters require a separate inline probe which connects to the input, or something like that. Any ideas?

Alinco DJ-162T handheld transceiver for 2 meters. Transmits AND receives on 136-174 mhz, and also receives 108-136 am aircraft band. Tunes the cellular band, but I have never heard anything on that band, so the receive may not be very sensitive on cellular freqs.

The radio comes with antenna, charger, leatherette case, 2 nicad battery packs and manual.

$160.00

Hi Tim,

I guess my age is showing, but time was when I would have given almost anything to get my hands on an old Motorola 200 HT. This was back in the '70's and those old 2-channel VHF sets were about the size and weight of an average clay brick.

The IC-2GXAT is indeed bulky compared to some of the other VHF HT's in the current crop. I chose a T-21 for my last mono-band HT. However, several persons in my CAP unit chose the 2GXAT. These were mostly ground team personnel and were as likely as not to be beating the bushes in the wee hours of a cold, rainy morning looking for a lost child or whatever. The saving grace of the 2GXAT is its durability. It is sealed for water resistance like many of the new rigs, and can take quite a bit of punishment without giving up. With the right battery, PS, etc., it is capable of sustained high power operation without overheating.

I, on the other hand, work as comm unit director on most search and rescue operations and get to keep myself (and my HT) dry and warm. *<:-} It's just a matter of what you need in a radio.

By the way, if you have acquired a T-22, I congratulate you on your choice. I have had the chance to use one for a couple of days and think that Icom really hit the mark with this one. For CAP work, the alpha display is great. As to mods, the T-22 will expand Rcv down into the A/C bands and handle AM de-modulation quite well. Your Icom dealer should be able to provide the mods. You might have to convince them that you have a reason for opening up the Tx, such as CAP or MARS operations. If that doesn't work, email me privately and I will track them down for you.

Sincerely,
Glenn Reed, KF5XB

I suggest you go ahead and use reverse autopatch anyway. Lets make the
FCC actually do thier job and come find us.(like they would even bother)
It seems to me from the discussion so far that lots of people are using
it now without even a postcard from the Feds.

KENWOOD DEFENDS DISTRIBUTION PLANS

Kenwood Communications Corp says its recently announced plans to make
its
products available in more retail outlets will help to rejuvenate ham
radio.
Citing concerns about the future of Amateur Radio and a changing
business
climate, Kenwood announced it was taking "some bold steps" to revamp
its
wholesale distribution scheme. The company has appointed three new
companies
(as yet unnamed) to wholesale Kenwood Amateur Radio products to "CB
radio
stores, truck stops, 2-way radio stores, and electronic re-sellers."

Kenwood said its new distribution strategy will benefit the hobby by
increasing the visibility of its Amateur Radio line through small
dealers to
help attract newcomers. In a June 10 open letter to the Amateur Radio
community, Kenwood's Amateur Radio Products Group National Sales
Manager
Paul Middleton, KD6NUH, painted a dismal picture. "When we looked at
where
Amateur Radio is today, and where it is going to be in ten years at
the
present rate of decline, the future looks bleak," he wrote, citing
competition from unlicensed communications modes.

The company also says it plans to offer a new, free pamphlet or "primer"
about Amateur Radio to introduce people to the hobby. Kenwood also will sell
Amateur Radio study guides and is urging its authorized dealer network to
help distribute the new materials. "It is also obvious that the rate of
no-code licensees is slowing down with fewer and fewer people upgrading,"
Middleton wrote. "Amateur Radio dealers should be more interested in
attracting new people to our hobby. Every current amateur operator who wants
this hobby to continue should be promoting ham radio to non-hams."

Middleton said Kenwood intends to "work hard to expand the hobby" to insure
its survival and to expose more people to ham radio in more locations. "We
think more people would become responsible operators if they are directly
exposed to Amateur Radio," he wrote.

I don't think this is a widespread problem. I've been getting Uncle
Wayne's magazine for many years now, and it never misses a beat. I look
forward to it every month. I also get CQ, but 73 is better for my taste.

Good luck and 73,

Brad

Been there, do that! I actually have a cell phone but I only use it for
work related calls(that is the only reason I got the stupid thing
anyway!) I'm just glad I dont have to pay the bill for the use of the

gadget, It's unbelievable what cell companies charge per minute of service. Believe me, the second work stops forking over the cash for the phone, it is going back to the shop!

Sorry to post to the newsgroup, but I missed the address of the original sender.
==========

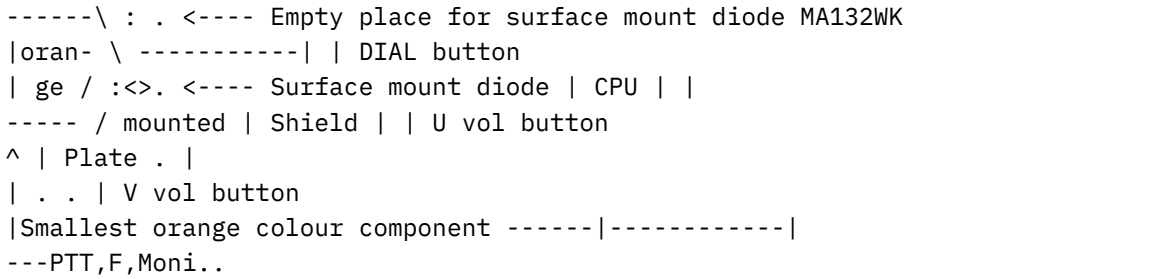
Receive only expansion:
---
1) Turn radio off
2) Press [B]+[#] switch and turn ON radio.
Depress [B] and [#] only when the display shows all functions and
the radio emits a beep.
3) Go to SET mode and a new function will appear after TONE selection.The
new function is designed by PL. Set PL to "1"for 1 MHz frqcy. enter,
to 10 for 10 MHz frqcy. enter and to 100 for 100 MHz frqcy. enter
resolution.

Note1: This modification does not reset information saved on the CPU.
Note2: Frequency range is 50,0-107,995 MHz FM
108,0-135,995 MHz AM (aviation band)
136,0-299,900 MHz FM
for the VHF portion;
300,0-999,900 MHz FM for the UHF portion.

REMEMBER: It is illegal to listen cellular fones conversations!
Some frequencies are not allowed for listening. Those
restriction varies from sate to state.

TRANSMIT EXPANSION:
---
1) Call Icom Parts Dept. and order one diode MA132WK (D.23) for IC-W21AT,
Symbol: MU;
2) Open radio and localize the logic unit;
The logic unit is the half portion of the radio that contains the CPU,
display, keyboard, etc...;
3) Localize some orange colour components in the lowset right part of the
portion, below the CPU shield plate.

Localize the smallest orange colour component. Note a empty place for a
surface mount diode (3 dots) near this orange component (see draw below);



------\ : . <---- Empty place for surface mount diode MA132WK
|oran- \ -----------| | DIAL button
| ge / :<>. <---- Surface mount diode | CPU | |
----- / mounted | Shield | | U vol button
^ | Plate . |
| . . | V vol button
|Smallest orange colour component ------|------------|
---PTT,F,Moni..

4) Add D23 MA132WK diode in the empty place.
Do use very fine soldering iron and temperature controlled gear.
The circuit is very fragile and may burn if excessive heat is applied.
Take care for static damage also; If you can, use professional gear
for this purpose or find technical assistance of your choice.

Note1: It is illegal to transmit out of band without an appropriated
license for MARS/CAP.
Note2: Icom does not guarantee the mod nor the specifications;
Icom and the author don't take any responsibility if any damage
occur while performing the mods.

-FULL CROSS BAND REPEATER OPERATION-
This feature enables HT to receive on one band and retransmit the content to
the other band. You can even choose tone squelch selections, repeater offsets
and many other features available during normal operation.
1)Select frequencies on VHF&UHF and options (tones, DUP,...);
2)Set "key lock" by pushing [F]+[C] keys. Then turn radio off;
3)Push [F]+[MONI]+[RPT-M] keys and while holding them pressed, turn radio
on. You will get flashing "L", telling you cross band rpt. is enable.
4)Press [F]+[C] ("key lock" release) and you will clear the cross band rpt.
mode.

I just recently resubscribed to this newsgroup and apparently came in at the some mid-point of this particular thread. I am not expressing an opinion, just wanting to ask a question.

I use a local repeater near my home. It is run by a small, low-key ham club. There is a reverse patch operational on it. To use it:

1. You must be a member of the club.
2. You must be an amateur licensed with priviledges for that band.
3. You must know the phone number and touch-tone code to open the reverse patch.

When the reverse patch is used, no tone of any kind is emitted. The user dials up the line, enters the code and is put on-line. The accepted procedure is to listen for traffic and hearing none, to call the intended station and identify your station. If contact is made, great. If not, then usually the calling station will sign off and hang up.

I have found this useful on a few occasions when I was out of town and needed to contacy my wife who is a ham also and is in the car much of the day.

The question is, does this method of operation meet with acceptable criteria or does someone think that this is illegal?

Thanks,
Glenn Reed, KF5XB

I am sruprised. In my area we only have 1 repeater that runs a
reverse patch. our systems are too busy for that. the machine is
operating legally buy as more people get on the band, I point to the
promotion of Kenwood, I would re-consider it.

>be the nail-in-the-coffin for this hobby.

You're wrong, Dick. Today's amateur works at a different functional level, but they are still learning and experimenting. Did you blow your own glass for tubes and make your capacitors from scratch when you started out? Of course you didn't. But the amateurs who came before you did. Does that make your tinkering just the act of a scavenger feeding off the bones of a war's excess, and the previous generation the one which was really committed? No, of course not. You used what was available to you. Today's amateur uses what's available to him. That includes things like complete subsystems on a chip or board, and software or firmware on a disk or EPROM.

Instead of single circuits containing 30 components, today's amateur works with single chips containing thousands of transistors and complete subsystems containing dozens of chips. This is his equivalent of the surplus you scavenged. His tinkering can do lots more complex and interesting things than yours could, just as you could do lots more complex and interesting things than your predecessors could with galena and Model T spark coils.

I started in amateur radio when the transistor was just starting to displace the vacuum tube in new radios. I had the chance to work with some of the boatanchors mentioned earlier in this thread as well as the more modern designs. I converted Motorola 5V and 40D taxi radios to 2m when FM was just starting, and there're still pieces of a gutted ARC-5 in the bottom of the

junk box somewhere. But I work with microprocessors, DSP chips, and complete transmitter and receiver subsystems on a chip now. The basement is still busy, and lots more productive today. Why isn't yours?

In twenty more years, there will be oldtimers talking about the good old days when hams had to edit their own config.sys files and some radios still had knobs mechanically connected to variable capacitors or resistors, and newcomers will wonder what in the devil they are talking about. Technology moves on. You can stay current, or live in the past, but it is those who stay current who'll be doing the new and exciting things.

(Not that resurrecting old hulks isn't fun too, but it's a nostalgic type of fun and not exploring new ground.)

Issac Newton said that he could reach far because he stood on the shoulders of giants. We do not need to regurgitate phylogeny to progress. We don't have to reinvent the wheel in each new generation. We can advance by standing on the base that has been built before. Many of the things you did are now buried deep inside a chip. We don't have to replow that ground. It's now a given. We can build on what has come before without concerning ourselves with the details of that previous work.

Even in the 50s, not every amateur was a tinkerer. Some just bought radios and operated. That's still true today. That's not a disgrace either. There's a place in amateur radio for operators as well as a place for builders. We who build can moan about the knob twiddlers, but I'd be lost in a Dx pileup (not that I'd ever deliberately get in one) and they wouldn't. Different facets attract different people. Darn few of us are Renaissance Men who can do all things well.

Hi Glenn,

From your description, it sounds as though this system is one of the few that actually *IS* legal! CONGRATULATIONS!

The debate really centered around the "emission of a tone, or ring" that might be initiated by an unlicensed 3rd party... which the FCC pointedly told us was not permitted. Not only has your group eliminated the "tone," you have also taken steps that ensure *only* hams with appropriate privileges have access to the system. Sure sounds like a winner to me!

Best regards,
Stan/KD9BE

I enjoy "debating interpretation" of our rules, but when "the law" is made clear to us, as in this case, I would not encourage others to purposely violate it. Shall we encourage murder... *if* you think you can get away with it due to poor enforcement? Get real!

Encourage people to *follow* the rules. Ham radio would be a much better place than it is now if everyone did! If you don't like the rules, then petition the FCC to make changes... they just might do it!

Best regards,
Stan/KD9BE

1128. ICOM IC-T7A Mods Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-20 00:00:00 UTC
From: mplat@airmail.net
Message-ID: <4srfmc$knf@news-f.iadfw.net>

1132. New Yaesu FT-600 HF xcvr

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-20 00:00:00 UTC
From: Bob McDonald <mcdonld@ix.netcom.com>
Message-ID: <31F15D26.1053@ix.netcom.com>
Source record: 197514

Anybody know anything about the Yaesu FT-600 other than what Yaesu advertises about it? I saw a ad for it in the August QST I received today. I am looking for a portable and mobilable HF rig, and am considering the Icom IC-706 and the Alinco DX-70T. This new Yaesu model looks like a choice to consider. No 6 or 2 meters, though. It is built to MIL-STD 810, which might be useful in mobile/portable operation.

My goal is to get a mobilable and portable all-band HF rig for CW and SSB that I can also use as my base rig (I have been away from HF for quite a while). It would be nice if it covered all modes on 2 meters, so maybe I could try satellite work or shuttle communications (is it realistic to hope to use the IC-706 for such operations or should I get a separate rig for 2m all-mode?), but this is not essential. I would take significantly better HF performance over VHF ability. I have been reading this group for awhile and have the basic scoop on the IC-706 and Alinco DX-70T from this and other sources.

Well, Gary is NOT the FCC...here is their reply to the question....
If you have any problems with it, try to get the rule changed! But breaking it doesnt make it right or legal:

Subject: Reverse Autopatch on Amateur Radio repeater systems -Reply
Date: Thu, 18 Jul 1996 08:39:44 -0400
From: Bill Cross <BCROSS@fcc.gov>
To: cboone@earthlink.net, fccinfo@fcc.gov

The ruling has not changed. Those trying to argue that a part of the call (the ring etc.) is "telemetry" are trying to find a way around a rule they don't like. This e-mail is your writtem confirmation.

William Cross
Private Wireless Division
FCC

>>> Chris Boone <cboone@earthlink.net> 07/17/96 04:37pm >>>(Please forward this to those responsible for amateur radio service
inquires)
In a 1977 issue of QST (not sure what month), a letter that
answered questions about the use of reverse autopatch on amateur
repeater systems was published. This published letter was from (I
believe) John Johnston to the group that had originally inquired. In the
reply, the FCC's interpretation of Part 97 rules was that NO signal (not a
ring, tone, etc) could be activated by the reverse patch (either thru
DTMF commands or the line actually ringing) UNLESS a control op had
screened the call off the air FIRST, and there were no exceptions to the
rule.

Is it correct that this ruling has NOT been changed? I am requesting written confirmation on this. Some people try to justify it by saying the ring out on the air (or a digital voice announcement) is telemetry...I feel this is their way of trying to justify their actions but NOT inline with Part 97.

Thanks

SERIOUS WANT!

Collins 30K1 - 30K5 . These are AM Tx only rigs, 4-125 final
modulated by a pair of 75THs. Rack mounted. Must be in restorable
shape.

Will also consider Collins 32V1 or 32V? or close equivalent
AM rigs of the '49-early '50s period, if need be.

Any possible leads are also be appreciated. Thanks.

Well then, the obvious question arises. How am I able to access the BBS when traveling, at work or otherwise not at my "base" location. I this scenario, I can only call from one location unless otherwise allowed for by the system.

Additionally, this system (access from only one number) is more properly implemented using a call back system. What I dislike is the placing of major security responsibilites on the users and not the sysops. If a sysop allows easlily crackable passwords to exist on his system then he is sloppy.

I did not mention 800 numbers as well as 900 or 801 or more that keep popping up every day. Yes I do know that they have the "right" to know the ID of who is calling for them. I have no problem with that, they are paying for it. But I avoid these types of numbers when I can, or call them from work which gives them no information except possibly for what switch it comes from.

|>
|> >But... I take the other side of the coin and encourage others to not do

|> If I ran a BBS my response would be "If you need the information my service
|> provides, you've likely already given me your name/address/phone number; if
|> you
|> really want to get in, dialing *82 before you call shouldn't be too much of
|> a
|> pain."

Well Ok, but that is what makes the world go round. Or as my Dad used to say, "That's what sells Chryslers."

But the original reply was from Adran (I think) that made a blanket statement that he personally never accepts blocked calls, in addition to some snide

comments about what does a person have to hide if he uses blocking. I was responding actually to both posts. I should have been more clear, sorry.

And I have NEVER seen a BBS that had any information that I absolutely needed.

As a final note from me, I am sorely fed up with organizations or whomever collecting data on me, for whatever purposes they come with, without my consent or sometimes my knowledge.

I am also livid beyond descritption at the manufactures and sellers of this type of equipment and service that they have provided yet another more convienent means for this practice.

And since we can't do a damn thing about it, it's just another thing we as common people must have to put up with so the purveyors of these types of things can bring in the almighty dollar. It really makes me sick that corporate greed is more important than personal freedom and privacy to some individuals. And before anyone gets their panties in a ruffle, I am not accusing anyone that has posted here of this trait.

One question, what role does Lucent have with this?

Jim,

Whatever your beef with Chris, I don't think your posting or choice to air your differences with Chris in this particular forum reflects badly on your judgement. It is your reputation which would appear to be tarnished by handling the affair in this manner.

Yes. That's exactly why I don't accept blocked calls. I can
understand why you wouldn't want a tele-marketer to get your number
but, at least in my area, one can turn on temporary call blocking with
a simple series of numerical commands. Thus, the third party call
blockers are only for individuals who feel they need extraordinary
privacy *on every call* and that's why I wonder, "what have they got
to hide?" I have found one good answer to that though. The
auto-patches are caller ID blocked to prevent interference via phone
line access. I could also imagine, for example, a divorcee who needs
to call her abusive ex from time to time on "business" but doesn't
want to be harassed, But even this situation could be taken care of
selectively. In general, I have simply resolved that people who try
to hide their identity from me aren't worth talking to.

JEEZ! I guess you should go on the road and track down all of us evil
wrongdoers with our reverse patches before we hurt someone! Actually, I
don't use reverse patch and can't say I want to. BUT, since it doesn't
effect me in any way, I really don't care of someone does! You were
probably the kid in high school that got his but kicked for being a
tattle tale!

What you have is a standard Cinch-Jones connector (or TRW Connector). Most big electronics outlets should sell them. I looked at my collection, and I only have chasis mount 12 pin female connectors, and not a plug type. Ten years ago, they sold for about $1.00. I'm looking at an old Anchor catalogue (Queens NY). There part # for female connectors is S-312-CCT for a standard plug, there are plugs with keepers (that will lock the plug in if the chaisis mount is set up for it) and plugs with the caple clamp on the side S-312-CCE (the 12 stands for the number of connectors. I don't know that their minimnum shipping charge is, but their phone # is (718) 846-2420. You may also be able to get the connector right from Yaseau (remember if the radio takes both AC and DC power, there probably are jumpers in the connector that you will have to wire up properly - and will need the radio diagram.)

Jim, you wrote and published that Chris Imlay was providing less than
fully effective legal service to two of his clients on account of
conflict of interest. And you have repeated that allegation to the
Usenet world at large.

I believe that a defense of personal opinion is not available to you
in this matter. I believe that you will need sufficient proof for
your repeated allegations of professional malpractice to have Chris
at least sanctioned if not disbarred, or your defense will fail.

> I know you'll also agree that, if you choose to pursue litigation, the

>Jeff Cook

I am only a gonnabe lawyer, so I'm not going to express any legal opinions
regarding this dispute. However, I am going to say that I don't care much
for a scenario where a lawyer threatens litigation against someone who airs
an opinion that the lawyer is acting improperly. The First Amendment was
written precisely to permit ordinary citizens to criticize powerful members of
society without fearing legal retribution. When an attorney seeks to exploit
his stronger position vis'a'vis his ability to litigate, in order to suppress
free speech, this is not good.

In fact, I suspect (this is not a legal opinion, just a guess) that a court would
make short work of any libel case connected with this matter.

As far as the use of the internet goes, I kind of think that the internet
strengthens free speech, by giving those without ordinary media access
a public forum in which to express opinions. Nothing wrong with that, in
my opinion.

1160. opinions on IC-Z1A and FT-50R?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-21 00:00:00 UTC
From: reaper@I_should_put_my_domain_in_etc_NNTP_INEWS_DOMAIN
Message-ID: <4su3j3$nag@gazette.wv.tek.com>
Source record: 197526

I am in the market for a dual-band handheld, and was wondering what other people's opinions about these two handheld radios are.

The major points for me are that they be handheld, dual-band, and under about $350. All the digital bells and whistles after that are much less important. My current concern is that the FT-50 seems to be sturdier but less feature-full, while the IC-Z1A appears to be a better radio, but feels flimsier.

If anyone has any opinions on this, please let me know, either by posting to the group, or sending the email directly to me. If I get lots of private responses, I'll try to summarize what I get and post it back to the group, since I assume others will be interested.

If you want to reply by email, please use

ianj@pogo.wv.tek.com

since my current email address won't get back to me very well.

Thanks for your time!

It depends on what you want to do with ham radio. The frequencies below 30 MHz offer long-distance communication, but you have to have at least a five word per minute code ability. On 2 meters (144 MHz) communication is VERY short range unless there is a repeater nearby. Personally, I wouldn't let the limited budget stop me. Go out and mow some lawns or whatever kids do to earn cash and get something good. Used HF rigs can be had in the $400-$500 range (how many lawns is that?) and will be a ton of fun. See you on the air someday!

The original factory inverter was a very poor design, in my opinion. I bought one for my TS-520 and afterwards found out that it was only capable of running the rig at about half power. Of course, they didn't mention that beforehand. The factory should be ashamed of themselves. Use Scott's suggestion and get a real inverter.

Hello, Folks:

Anyone out there have any experience with the PC Flex software,
particularly the Sound Blaster sound card drivers?

I would be especially interested in how the 9600bps SB driver works
for you.

I am interested in doing some serious development of the local packet
network and I can get PCs and SB cards for a LOT less than I can get
TNCs (I have more than a dozen 386/486 PCs and a whole box full of
SB-16 cards!)

I noticed that the SB driver strongly suggests that a 486 be used.
Anyone tried it on a fast 386 (66Mhz+)?

Thanks!

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple carrier operated relay. You still need to provide a duplexer, antenna, & ID'er w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

Source record: 197584

Can anyone explain the reasoning behind the gap in receive coverage
between 200 & 300Mhz,its a bit of a nuisance when you like to listen to
the UHF Airband now and again.

This is a copy of the explanation from my dealer,

Hi Alan,

After further discussions with Yaesu it seems that the FT50 should
not receive signals between 200-300 MHz although the display will
show these frequencies. Generally the IF goes out of lock above 200
MHz.
At the end of the day Yaesu say that they do not claim that this is
within the scope of the receiver, so cannot offer any further advice.

Anybody know anything different i wonder?.
Anybody know of any 'hidden key' functions?.
Are there any Mod's yet?.

Regard's

1174. Re: Fm transmitters

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-21 00:00:00 UTC
From: radiomatt@aol.com
Message-ID: <4st9ue$kl@newsbf02.news.aol.com>
Source record: 197585

You might want to buy a used FM exciter, which is really a 10 to 50 watt FM transmitter that's capable of operating on your freq. I've seen used exciters in the range of $300 (crystal type) all the way to $2000 (synthesized) US prices.
BEXT and DB Elektronika both have new synthesized exciters (10 to 20 watts) in the range of 1300 to 1800 dollars --the latter would have a stereo generator included, since most don't, in keeping with industry practice.
You might not want to send stereo, since it reduces your noise-free range by about 60%, watt for watt.
Most big FM transmitters use the exciters, followed by amplifiers, in stages. For example a 20 kW transmitter uses a 10 watt exciter driving a 100 watt stage, driving a kilowatt stage, which then feeds the 20kW "final".
The reason, not the only one, is that amplifiers with high gain (10w direct to 20kW!) are unstable and can self destruct. Another reason is that if the 20kW stage fails, you can still put out 1kW by connecting the antenna directly to it.
Good luck

1175. Solution to running AC rigs mobile

Date: 1996-07-21 00:00:00 UTC
From: ham@w3eax.umd.edu
Message-ID: <4st7hn$8pe@dailyplanet.wam.umd.edu>
Source record: 197586

People always seem (in vain) to be looking for a Kenwood
adapter for their TS-520/820 radios so they can use them
while mobile. While I may question the wisdom of using
a 40-pound radio from ones car or van, this is not the
issue...

Inverters are an OK idea but are expensive.

Looking in this month's Damark catalog, something caught
my eye, and made me look twice:

"300-watt continuous/500-watt peak dual outlet inverter, $62.99"

Made by "Power-to-Go Inverters", contains a cooling fan as well
as low-battery alarm. Normal price is $70, member discount
price is $62.99.

So just because other people are "overdeviating" their TX, we should
have a radio which doesn't give out proper volume? I can't see the
relations at all. If you don't like people overdeviating, may be not
using a radio is even better.

>The FT-530, IMHO- was a much better radio. I don't know why they stopped making

>so small youll be able to put them on the end of a keychain soon!

I wouldn't mind a "Dick Tracy" type at all, if it works well. Small
does NOT equate bad quality, again, I don't know how you can make out
of that. You might want to use those made in the 70', if that might
make you feel better because they were built to be tough. I don't
think it is "cutthroat", (meaning small margin profit type business),
to build small radios. I think it is actually MORE expensive to build
smaller radios because of miniturization technology. Please qualify
what exactly you are referring to as the FT-530 being better?

Source record: 197594

I too suspect the FCC would come down hard on hampaging, especially since alternatives exist.
Pagers, with their mini antennas, are very inefficient receivers. Paging companies use high power (up to 3.5KW ERP) transmitters and multiple sites to provide reliable coverage (a NYC system runs from 20 to 170 sites!). These sites are synchronized to act in unison to provide commercially reliable service over a wide area. (With your 20 watt ham pager, you beep your kid, and get upset when he shows up six hours later claiming he didn't get the page)(With a commercial service he's on weaker footing for that kind of excuse!)

The alternative I refer to is the Private Carrier Paging, which can be used privately. Frequencies are at 157, 462, and 929 MHz. Power limitations are from 75w to 1 kW ERP. The benefit is that you can also SELL paging service on a PCP Channel, to offset costs and make a profit too. Since most manufactured pagers are pre-set for the commercial and PCP frequencies, you'll find economies of scale in purchasing pagers, both new and used.

On coverage again, I installed a 929 MHz paging service in Cincinatti once for a guy who insisted one site at 1kW would provide reliable coverage. He now has four sites, and is talking about more.

To provide local paging (1 to 2 miles) get the radioshack system at $99, plus $60 for each pager. It'll be far cheaper.

No wonder you're giving them away! Everybody knows used equipment is not
as good, reliable, or pretty as new.
Hell, you take a used rack, you don't get a guarantee, no manufacturer
support, probaly no manuals, no choice of colors, and no original packing.
And the paint might be chipped.
And what about suitability? Do you KNOW your equipment fill fit? Will the
dealer take it back if your rackmount pieces don't fit?
Not likely.
So forget about used racks.
Buy new!

Mark..

Since you obviously already have the computer, I'd suggest looking into packet, especially if there isn't much voice activity locally. A good used tnc is about $60 average. And a radio suitable for packet or voice use is about $150. Look for a mobile, with various settings between 1 or 2 watts to 25 to 50 watts low/high.

I'm sure there is packet activity of some sort locally.

Andrea, Have you tried the old negative volts up the ALC input trick?
For my TS520 about -6 volts will turn the power right down to zero.
Use a high-value pot across the volts source to vary the o/p power.
A nine-volt battery lasts for years...

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.swap

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple carrier operated relay. You still need to provide a duplexer, antenna, & ID'er w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

>anyone had any experience with radiated electronic module noise in Fords?
>
>Tnx es 73 de Don/W5FKX

This is not unusual in ANY newer auto. Most of the computers are noisy, and will get into your radio. Most alternators are already running at the limit, and may produce a whine, as well.

Solutions:

1. Run your power directly to the battery. If you need, or want, the radio to come on with the ignition, insert a relay in the line that is triggered by the ignition. (A wire to one side of the relay coil from the broadcast radio fuse, then to ground from the other side. Use 1 Amp fuse on hot side!) It won't hurt to use RG58 for the power wire. Ground the shield at both ends!

2. Go to Radio Shack and get the biggest noise suppressor they have. Hook it up as close to the radio as possible. Commercial radio shops may have suppresors available as well, but the Radio Shack one works well most of the time.

3. Try an autosound solution. Pick up some (2-3) BIG power capacitors. 50,000-75,000 mFd @ 25V should help. Hook them up across the DC supply to the radio. When you key, the caps will supply the extra amps needed for initial key-up. Available at computer junkyards and auto soud stores (for "stiffening" the supply to audio amps)

4. Bypass the power leads to ground with .01-.1 mFd disk caps.

5. Reroute the antenna cable and power cables away from other wire buncles, or lay aluminum foil over the adjacent bundles (grounded, of course)

6. Last resort. Cover computers with copper or aluminum foil. I have glued foil to the back side of kick panels or carpet.

Yes, I have concentrated on the power leads. This is where 99% of vehicle related interferance comes into your rig. Interferance come

through the antenna is hard to eliminate as the computers in most cars operate in the 2-10 Mhz range.

STAY AWAY FROM YELLOW WIRES IN ANY VEHICLE!!!!! These usually run to the air bags. The voice of experience says that the are EASY to trip, and make a hell of a mess! They cost a ton of money to replace, too!

The power to the battery usually does the trick. The battery is a great filter all by itself.

If none of these tips take care of the problem, learn to live with it, sell the radio, or sell the car.

Hope I helped!

Kevin N0OAS/AAR8GF

Could be the low/high power switching transistor is not functioning
properly....there is a xstr (Cant recall if its NPN or PNP) in the power
output control circuit that varies the power to the driver or final so
your output is cut back because of HIGH SWR or low power setting (same
xstr used in both operations)..

You may wish to check power out into a 50ohm dummy load with a GOOD Bird
or equiv wattmeter.....And maybe adjust the SWR shutdown control to see
if it is affecting your power output (it can if its misadjusted)

>any taxexs.....

If you do not have the radio in a box, how will customs know if the radio is new or not. I take radios with me all the time over seas and I have never run into a problem with customs. All they want to know is if a bomb is inside. If the radio is an HT, they'll ask you to turn it on, if it is larger, they'll look at this through the X-Ray machine.

Wrap the radio in a towel and go through customs.

The new HTX 242 has 10 additional memories (40 + call) and allows you to set any memory for inclusion or skip during memory scan. Also you can turn off the auto repeater offset feature. And you can store any rcv frequency in memory (136 - 174 MHz) not just 2 mtr frequencies, And, you can tell it to scan and put anything it finds in memory that itsn't already there (until all memories are full). And the button labels are back lit by lamps so they are easily read in the dark. Otherwise, it is the same as the HTX 212. There are a couple minor circuit changes that are in addition to the above but I haven't figured out what they do yet. I did find the mike is a bit different internally although it functions the same. It's a bit strange, you can't interchange mikes.

Has anyone used the tone squelch feature on receive regularly? I find that it sometimes drops the audio.

Wait a second ...

If a fellow is working for two sides of an issue at the same time there
has to be no proof of conflict. You can not prosecute and defend. There
needs to be no proof.

I can't hire an FCC lawyer to represent me should I be accused of
a Part 97 rule violation. The FCC would see that, without proof, as
a conflict of interest.

Now, is the ARRL seeing their lawyer as being in a conflict of interest?
We've not heard from them. Maybe we should wait for their thoughts.
I hope they comment as I don't want to make my judgement based on
what has been presented here (and with the implications a lack of
comment would have).

Expressing an opinion that someone in a membership organization is
out of line is part of the democracy of the organization ... right?
The legal threats which resulted were sad. I would have defended
myself in a reply. Let's hope he was just too upset to see an
alternative course. If not, he's doing a pretty poopy job (I'm a
member! I'm a member!).

Hi Bob, Saw one of these in Hong Kong this past weekend. It is interesting because the Hong Kong dealer mentioned some keypad command that would swap the rig from VFO type operation to totally channelized operation. Apparently this rig is hoping for FCC Type Acceptance for commerical HF (maybe maritime operation). The thing is built tough....like the FT-2400 and the like. My only complaint was lack of features...it is really "plain Jane". Price was about US$ 680.

Also saw the new Alinco DX-701. This has similar features and operation as the new Yaesu FT-600 -- is intended for the maritime HF / Commercial HF application. Same basic chassis as the Alinco DX-70 but lacks the 6M side and is "stripped down" (ie, no IF shift, no squelch, no FM, etc). Price was US$ 700. Out of the box it will work like a normal VFO'd radio, but a key combination will "channelize" the unit. Has a slightly different VFO knob, but otherwise remarkably similar to the DX-70.

Well I changed mine to my call and it seems that it was a matter of addressing the memory it was in, I think
its in the book.. as far as the " diode bend" the mod is to remove diode D 15 I think it is and reset the
radio.. this then allows the radio to --- drumroll here " transmit out of band.. the darn thing is pretty
small I think (surface mount). the dealer said he could do it dor 40 bucks and then gave me the instructions..
the radio works fine as is (on the ham bands) so I haven't done the mod.

I have a question. If you are calling into the repeater by phone to
access the patch, why do you identify YOUR station? You aren't using
YOUR station and most repeaters identify themselves. Just curious.

If your are calling in and "taking control" of the repeater, you are a
designated control operator of the station - this doesn't change the call
sign.

> I have found this useful on a few occasions when I was out of town and needed

With the exception of the call sign question I'd say it was a perfect
example of a fully compliant reverse patch. BTW even that call sign
thing is legal since you can use your call sign on the telephone if you
want.

Caller ID blocking is to HELP keep those who have unlisted numbers numbers
unlisted. Telemarketers pay good money for lists of phone #'s. For example you
call the local Electronics dealer for info/pricing etc on some widget you want.
He has caller id he notes your name # etc and add's it to the list to be sold
later. BTW 800's usally can't be blocked so ya still get knackered.

No equipment is NEEDED to block caller ID either BTW, simply dial *67 then the
you wish to reach

Best thing to do is find a pilot who is current. He/she will have a
an airport directory for North America. All of the radio frequencies
are listed with each airport, along with plenty of other data.

>Once again you try to BEND the rules to YOUR liking..

Please note, there is no patch on my repeater, forward or reverse.
There is, however, telemetry on the repeater. If the FCC rules
telemetry must be vetted by a control operator before being transmitted,
then many repeater systems will be in violation, as well as a number of
other types of stations, including all amateur satellites.

>So much for your telemetry argument...

This is very disturbing. Since federal laws and regulations must
be interpreted and enforced uniformly and consistently (required

by the US Constitution), I will now be expecting Mr. Cross to cite
every amateur satellite, every repeater, and every APRS station now
in operation for reporting telemetry without it first being vetted
by a control operator.

Just wanted to pitch my two cents in on this one.

If Kenwood is truely going to start marketing their ham radio gear at
CB shops and truck stops, then I feel that we should let that become their
one
and only market for their overpriced equipment.

Let them try to get $499 for a "two-way" out of the $49 CB market.

My call on this one - boycott Kenwood Amateur Radio products. Of course, I still
haven't forgiven Radio Shack for over the counter sales of ham gear without
checking for a license. Guess I'm just an old fashioned kind of guy.

Just my opionion.

Hi Lewis

I am also using the FIF-232C with my FT-1000
I have no problem with it. You are sure the connection is right ?
I am using the Software: CCat V1.0 running under Windows
You found it on the QRZ!-Ham Radio CDROM from JAN.1996,Vol 6
The CD is made by Walnut Creek CDROM

Turn at first the Computer, the RIG and at last the FIF232C on !
Then run your programm.

You can also use Programms are written for FT-990

I hope this help

Well, it's easier to use chicken wire. :-)

Sure, a number of articles have been published on making your own
dish. The Handbook had one on a 24 footer made from EMT, fishing
line, and chicken wire. It's called a stressed dish design. The
only tricky part is the hub, everything else is strictly backyard.

: The factory should be ashamed of themselves. Use Scott's suggestion and get a
: real inverter.

Bill, I agree with the first part of that (poor design and half power/factory factory should be ashamed of themselves). But the advantage of the built-in inverter over the external inverter is that you have the one-box solution. OK, it's one very *heavy* box.

And I found the reduced power to make life somewhat easier on my wiring and electrical system.

If you have a well-stocked junkbox, it's pretty simple to homebrew the inverter. Since it uses the regular AC transformer which is mounted inside the rig, the hard work is already done. All one needs are a couple of germanium PNP power transistors on a heatsink with a bias network of two resistors and a capacitor, as per the Kenwood schematic and parts list.

I used a couple of silicon power transistors on a homebrew heatsink to substitute for the original germaniums on the factory heatsink and wound up modifying the bias network to compensate for the lower gain of the Si transistors. It works, it ain't particularly pretty, but it cost me nothing.

1219. Re: Tahoe/Suburban Ant Help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: k5qq@aol.com
Message-ID: <4t15pl$h2n@newsbf02.news.aol.com>
Source record: 197377

I just got a 96 Tahoe and punched the 3/4 inch hole for the NMO by removing the dome light that is just past the end of the overhead console, and just behind the front seats. Then I pulled the side panels away a bit and was able to get the cable pulled thru the
space between the roof and the headliner over to the side. Down the side and under the carpet to under the passenger seat.

I'm using an ICOM 2700 with the remote head and put it in the space in the front of the overhead console that has the 7 X 3 inch roundish plastic in it. If you drop the console by unscrewing the front phillips screw, you can take that piece out real easy.

Finally, for the masterpiece, I am using the remote mike and it just sits on the console between the seats. NO WIRES VISIBLE

The whole thing came out pretty neat and looks great with all of the cables under the carpet. Also, on the floor sill of the passengers side, you can lift that up and there is a channel for the power cable. Run it thru to the battery by finding where the car radio antenna goes. They have a 3/4 inch hole for that with a gigantic rubber plug. Can't believe I was so lucky.

PS This is the Wife's car so you know I was cautious about drilling a hole.... My old Mitsubishi has 11 antennas on it (with doppler installed) and has a 2.5 inch hole for the mast of the T-Hunt beam so drilling holes dosen't bother me like it does some folks - including my wife...

Good luck and the difference in performance between a roof mount and a cowl mount is significant.

From: Chuck Hanson <crhanson@athenet.net>
Message-ID: <31F454AA.2FF9@athenet.net>
Source record: 197384

I have a IC-W21AT Icom HT that gets warm on the back corners of the case, below the antenna and below the mic jack. The radio has been doing this for quite a few months. Yes, it heats up even when it hasn't been used for transmitting.....just sitting on a table recieving heat will develop. Naturally, the battery doesn't last very long. Also, a few weeks ago this radio has developed another problem....it doesn't scan right away when you push the "*" or the "#" keys. You have to press the "B", "A", and "C" keys many times before the "*" or the "#" keys will work. I can't seem to get it to scan without fooling around with all the letter keys first. I have checked the belt clip screws to make sure they are the correct length. If you have had any problems such as these, please email me direct at: crhanson@athenet.net

I have reset the CPU both partial and a full reset. Niether one made a difference. I really don't want to send it in to Icom, but I might consider it if the repair cost would not be too extreme.

Thanks for any help you could give me on this problem. 73 Chuck - Appleton, WI

I took a near miss recently that blew the meter in my hygain control box. the box was connected to commmercial power, but was disconnected from the tower with a jones plug.

This rotator has the CATS installed brake delay. if the jones plug is disconnected, the brake delay LED goes out 8 sec after being engaged as it's supposed to do. If i hook up the rotator, the brake will not re-engage without shutting the box off for a second. Any ideas about where to look? tnx all.

One thing to try is grounding the exhaust pipe near the rear of the car.

The muffler / cat. converter assembly tends to be mounted with insulated mounts, and becomes an antenna. Use a piece of shield from RG-8 and a pair of crimp lugs, and build a ground strap.

Don

Regency came out with something that used "combs" to select the frequency, and SBE had the "Optiscan" (also sold under the Sears name and a different moniker) which had insertable cards, with little square stickers that you peeled off of them to open light channels in the card (I had one). It was great for pre-programmed "regions" and super while mobile. I think it was a 16 bit system, a big book to do the lookup for each frequency, and was a 10 channel unit. It read the cards by incandescent (yes!) lamps.

Both were around the Bearcat 101 era.

I replaced my Optiscan with a Bearcat 210 (the original, not the XL model), which I might add, is still alive and working nearly every day.

- If you want strange, Bearcat even had a scanner (briefly) that attached to the Commodore-64, if I recall correctly....

> becoming damaged. if so, how?
>

Sure. If your outlet ground (third pin) doesn't have a very low
impedance path to ground (the same ground your antenna, phone line,
and other systems reference), your protector won't touch common-mode
surges. Also, depending on the waveform of the surge, some parts
of your protector may not react fast enough to blow.

Another thing: to pass UL 1449 certification, an AC protector
only has to limit surges to 450 volts or so. Many cheap power
supplies will fry at a lower voltage.

73 has mostly been a medium for Wayne Green to propagate his anti-ARRL views. I never felt it was approiate. The price started out at 37 cents (73 backwards) back around 1961 or so. It was the only ham magazine I could buy at the newstand and for a kid, 37 cents was a lot. I did enjoy looking through the adds though.

I wonder if the internet is going to hurt magazines? It seems like I can find all the advertising I need right here on the Webb! Not to mention the classified adds. Just watch and notice if the magazines don't start shrinking in size very soon.

Hi, Steve. I think you are correct. The Internet will certainly take its toll of the printed media. In only a few years I suspect we will see no more telephone directories, classified 4th class mail and (hopefully) no more 73 Magazine!!!!!!

Burt.....eldr@sover.net

1248. Spectrum Analyzer range??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: tim_shearer@mk.com
Message-ID: <4t0g4m$pkk@esgadm.esg.mk.com>
Source record: 197406

I acquired an old spectrum analyzer and some documentation for it.
It is a UPM-84 / TS-1011 ... and so on (lots of sub numbers)
My question is what is the usable freq coverage of this unit?
The literature I have refers to fequencies in cps, kc, and mc which
I translate to hz Khz & Mhz. The problem is that the scales go from
10 to 40880 mc which is 40 Ghz !!!

Could this be true of a spec analyzer that I think is from the 40's or 50's or
maybe it's not that old. It has N connectors all over the front and a huge
direct freq input connector for waveguide (about 2" dia but looks like a BNC in
the center). It has a klystron inside and weighs about 100 pounds !!!

Any info appreciated

Tim KF8XW

Source record: 197407

To all:

I have an Alinco DR-130 that during scan will stop on an active freq.
for about 5 seconds and then continue even if the transmission has
not ended. Does any one know of a mod that will change this so that
it will stop on an active freq. and not continue until the transmission
is complete.

Please respond to this newsgroup or email bduer@houston.geoquest.slb.com

Thanks,

I just saw on Yaesu's web page a new commercial radio that looks just like the 10R with some nice features. I know Yaesu makes this new commercial radio in a dual band version but I don't know what it's called(VX-50)??? I'm just wondering if this new commercial radio is the same as the 10,40,and 50R radio's with just a new keypad the lets you have 8, YES EIGHT, alapha tags, voice encryption,BCLO,BTLO(whatever thoes are)mil-spec C/D/E and PC programmable deveation,power level and squelch settings. If anybody has any info on doing this or the Vertex radios let me know. I will also let everybody know what I find out.

Bob:

I Don't know the alinco radio in particular, but I do have several 2 mtr radios that scan amd they all have
the same approx features.. Check your book under scanning and I think you will find that you have 2 choices as
to how the radio acts once its found a freq to settle on.. one is the "sample" and the other is like hold. Etc
company calls it something different,, but look closely at the book and I think you will find it isn't a mod
you need, only a change in setup..
good luck & 73's

Jim Christensen N0EXP

Hello My Name is Doug and the Qth is Yucaipa California about
100 miles east of Los Angles. I have for sale a Yaesu FT-530
and a list of goodies....

Ft-530 with expanded TX/RX Mod
RX 110 to 180 200 to 500
TX 130 to 180 400 to 470

Unit is Very good condition minus a few
minor cosmetic scratches. This Radio has
always performed flawless... It is a hard to
let go of!

Features: CTCSS incode/decode 82 memory channels
two vfo for each band dtss squelch and paging 10
dtmf memories built in VOX dual vhf or uhf RX full
duplex cross band 4 power levels independent volume
and squelch for each band and much more I cant remember.

Included:
MH-29 Multi-function digital display Speaker
mic.

3 fnb 25 7.2 600mAh batteries (2 brand new)

1 fnb 27 12 800mAh battery

1 CSC-56 Yaesu case for use with fnb25

1 cigarette lighter adapter

1 power cube for charging fnb25s

1 power cube for charging fnb27

Price $ 400.00

I have all the original packing boxes and manuals.

If interested contact me at....

phone: (909) 797-8644
fax: (909) 797-2023

1255. TR-7 low power above 40 metres

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: pepperb@gov.on.ca
Message-ID: <4t02k5$u29@govonca3.gov.on.ca>
Source record: 197413

I am looking at a TR-7 that is for sale, no big rush on it. The fellow showed me that it has full power (100w +) on 160, 80, 40 m. but after that it falls progressivly lower on output, at about 70 w on 30m, 50 w. or so on 20 m. and so on.

It seems to not just give enough 'ALC drive' on those bands, such that the green light for ALC does not come on.

So, if anyone has ideas, I'd like to know. He does not have a service manual, though I do have a friend who used to own a TR-7 and might know his way around inside. Is there a place we can 'align' ALC for the low output bands, or is there a problem elsewhere?

I realize a good thing is that Drake can and will provide service, but I thought I would ask here first.

Thanks,

Brien

I recently had a near miss that cooked my modem, modem power supply (dead short), and rotator control box. the control box was disconnected from the tower thru the use of a jones plug, but it was plugged into the wall.
the modem and its supply was plugged into an "EFI" brand surge protector. Surprisingly the surge protector was not damaged. The modem was not connected to the fone line at the time.

i sent the protector back to EFI asking them to honor their warranty which said that if a piece of equipment was damaged while connected to it, they'd pay for it. They refused, saying that part of the warranty (which they dont spell out in the "fine print") says that the surge protector must be damaged for the warranty to be honored. They also said the protector was UL tested.

My questions are these:

1. is it possible for a surge protector to pass a surge without becoming damaged. if so, how?

2. When I was in grad school, i remember a term "warrant of merchantibility". would this apply in this case, in spite of the limited warranty they want to honor?

From: blackie@gate.net
Message-ID: <31f1c1aa.1162762@news.gate.net>
Source record: 197539

I am considering getting the software and cable for my FT51R. I would like to hear from people who use either one of these software packages so I can make an informed decision on which one I should buy.

I went to EZ clone's web site and read the lit. It appears that it is in beta testing. I don't have a problem buying software that is in beta, but I need to know from users how stable it is. I have had experience in the past with beta software that has a tendency to crash my system ie: Netscape 2 beta x.

It seems as though EZ clone is available for several platforms which is nice. I would appreciate any opinions on this topic.

Thank you,

Craig aka Blackie Lawless

I think some of you are missing the "real" point. (Just to take this in a different direction)...

Has anybody SEEN 73 Magazine in the last year or so? I mean, has anyone LOOKED at it? Not only is the quality down, but there's pictures in the wrong places, with the wrong atricles, pictures used TWICE, pictures upside-down or 90 degrees rotated, articles where they reference a continuing page, and the article is not there, and even the same review article, repeated two months in a row -but edited differently- man, it's like a bad "where's Waldo".

There's even "fluff" articles, like a recent one on how to modify a radio into a repeater, yet no real diagrams - it's more like a letter to the editor that they said "hey, let's turn this into an article!"

I know that they have had personnel problems. I know that they don't pay much, and I know above all that their subsciptions are most likely down - as well as advertising, which is the lifeblood of the magazine.

I remember the glory days of 73, when the front cover was only the table of contents and the magazine was as big - if not bigger - than QST. I'd like to see 73 survive, but looking at the way it's being (or not being) edited, it makes you wonder.

Whatever it is they're smoking in Peterborough these days, I hope they'll sell me some. ;)

> needs to be no proof.

Not necessarily, it must depend on how many sides there are. The
question is not whether Chris is working for two sides of an issue
but whether it is for two *opposing* sides. Is there an issue for
which he represents two parties where the advancement of one of his
clients' will come from a disadvantage to the other? If so, then
this would be a conflict. What is that issue where this now obtains
for Chris Imlay, Steve? Is the SBE petitioning for 2m? Is the ARRL
going after the TV bands? Do the parties have conflicting positions
on responsibility for EMC?

> Expressing an opinion that someone in a membership organization is
> out of line is part of the democracy of the organization ... right?

The criticism was not about membership behavior but about the
behavior of a professional employee of two membership organizations
in that employee's professional capacity. Chris did not lose his
rights to defend his professional reputation by joining one or more
of the client organizations.

From: horse@magg.net
Message-ID: <4svvc4$4aj@dopey.magg.net>
Source record: 197551

Hi,
I have an MFJ Model # 817 144/440 mhz Deluxe SWR/Wattmeter. The Forward Power Needle does not move when the mike is keyed down. The diodes have checked out OK with an Ohm Meter, but the Forward Needle is OPEN!
Any suggestions to repair it?
If anyone has the meter portion of this piece of equipment that they would be willing to sell, I'm interested.
Tnx & 73, Doug KD4HRT horse@magg.net

Seems to me that Ted is committing a felony by conspiring to commit a
crime or advocating the commissioni of a crime. It is a shame that
some people believe that they are free to break any and all
laws/regulations/rules until they get caught. And then, of course,
they squeel like pigs because the SYSTEM is so unfair. How do I know
this.....
Well I make a pretty fair income defending people like Ted. Most of
my clients are just plain folks that did something wrong, got caught,
do the time, and will never again break the law (major ones anyway).
Jerks like Ted make me sick but I have to deal with them too. The
former are treated with respect and sympathy, Ted gets proper legal
representation AND THAT'S ALL. No extras from me, guy. The attitude
sez it all.

1275. Re: Home brew a drop-in charger! Was:Charging FT-50R's FNB-41 Battery

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: 73573.1504@compuserve.com
Message-ID: <4t02rf$26q@nntpa.cb.lucent.com>
Source record: 197554

I have built a homebrew drop-in rapid charger for the FT-50R. It uses
a W&W charging cup and charges the battery in about 1 hour. I used
the Maxim MAX713 IC in the charger. The circuit was taken directly
out of the Maxim data book and uses about 3 capacitors and 3 resistors
in addition to the IC.

The charger works very well. The advantage that the W&W charger
provides is that it can charge diferent batteries (different voltage
output & different capacities) without reconfiguring; whereas mine is
wired specifically for the the FNB-41 battery pack and would have to
be rewired for a different battery pack.

I would be happy to post the plans for my charger, if there was any
interest and there was an appropriate place to post binaries.

1276. RAM chip UPD444C from NEC ???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: frode@dxcern.cern.ch
Message-ID: <DuyAr0.AIL@news.cern.ch>
Source record: 197555

First of all I should like to thanks all of you that replied
to my earlier request concerning problems with the PLL card in
the ICOM IC-751. I have now changed all the trimmer capacitors
and I am only waiting for an electrolytic capacitor and I am ready
to retune the card.

As I now have the radio open on my table I decided to have a closer
look at the RAM module. My idea is to make an interface that will
allow me to read and write the protected area of this module. I am
now tracing the RAM module circuit to make a schematic diagram, but
I have run into the following problem. The memory chip used is a
1024 x 4 bits static RAM chip from NEC with the designation:
UPD444C. It is in a 18 pin dual-in-line package.

This chip is no longer manufactured and I have been unable so far to
find any documentation. Do any of you have any documentation or
information about this chip? I am specially looking for the pin
designations.

1277. FT-50R Mods??

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-22 00:00:00 UTC
From: Tom <tkoliver@telis.org>
Message-ID: <31F39E21.7DC7@telis.org>
Source record: 197556

After reading numerous messages about mods for the Yaesu FT-50, It is obvious
that there are now only a few avenues available...EZ Clone or ADMS-1C software,
and the mods from Bill Childers'(KE6VVW) "(In)Complete Guide to the Yaesu FT-50
Version 1.1". I have a few questions that have not been posed however.

I've performed the xmit mod by removing the solder bridge jumper behind the
keypad, but has anyone "discovered" what the other two solder pads do to the
FT50 if they are jumpered either one at a time or together?

Is there a source for Macintosh programming software for the FT50? (My guess is
NO!)

If there are other sources for the programming cable (RT Systems, EZ Clone,
etc.), then there must be a source for the necessary 4-conductor plug. Where?

As to those who have had the PTT cover come off...The radio has a one-year
warranty...It's only been out for a few months and should be repaired by Yaesu
at no charge.

> 73 Mike Manassas, VA

Mike,
I installed a R7000 about 2 months ago and it works fine.
I build the R7000 following CushCraft's directions and it
tuned on the first try.

I have tested it against a dipole, cut for 20 meters, and it is
my observation that the R7000 to work as well if not a touch better.

I am happy with it and the R7000's stealthy profile make my
neighbors happy also.

I hope my opinions help.

Although I don't consider myself a "geezer" yet, I am also from the era of crystal-controlled rigs and 1-year non-renewable Novice licenses.

When I got my General I went looking to expand my station and got a few of those ARC-5's to play with, including one of the rare rigs that covered 160 meters (well, close; you had to loosen a locked-down variable cap. to adjust it down to 1.8 MHz). (What did they use for locking compound on those darned things, anyway?)

It probably put out 40 watts or so. That loading coil seemed to be able to match just about anything! I had a great time on 160 with a simple antenna and worked quite a few states.

I remember Barry, W9UCW, "Mr. 160" in my area at the time, telling me it had a loud backwave at his place 15 miles away. I never did get that problem solved...

Yes, even at that age, it could go that high in freq using harmonics
of the klystron and feeding the mixer stage. Sounds like a military
version of a polarad analyser that I have used. Remember, the
klystron drifts like an unanchored boat, so if you turn the
dispersion down to a few khz and try to view a signal at a few gigs,
the screen display will drift all over. 73 KD3SH

I also was shaking my head while reading the article in the latest QST.
They say that Kenwood is concerned about the current direction that ham
radio is taking. So they plan on selling there Ham gear in truck stops.
It sounds like a plan to get more bootleggers and jammers on 2 meters.
Who does Kenwood think they are kidding, the only concern on the
direction of Ham radio they have concerns about is the increased sale of
Kenwood radios. Dont miss understand this for a insult to truckers,
that is not my point. There are plenty of good hams that drive trucks
for a living, and they buy there ham gear the same place the rest of us
do.

Well... like Gordon said - 23cm band, and the general vicinity. The dish itself
isn't frequency dependant. It's the downconverter that will determine
"what it brings in". I believe Dick used it for listening to Skylab and some
of the Apollo missions too. Oh and it was 24yrs ago. :)

I just sold mine for $165 with similar accessories. This is a fair price. Now,
if I could just sell my 2-meter mobile HTX-212....

The DJ-162 will show 800MHz freqs. in the display but does not have the
electronics to actually receive those freqs. There are no mods for 800MHz
receive.

The audio on this radio is excellent and mine was very reliable over the two
years I owned it. It is also an excellent radio to use mobile if you have a
place to clip it overhead beacause of the top-mounted LCD. I would highly
recommend this radio for someone starting out or someone who needs an
easy-to-use HT.

Hi Steve,

The strangest case I have heard about from your side of the pond, was
reported in "Flyer" magazine. The customer sued Robinson helcopters
because he claimed that the throttle control was not strong enough, it
broke and this caused the helecopter to lose power and crash - Fair
comment, BUT the guy had taken a loaded 12 gauge shotgun with him, this
had gone off accidentally, and the un-checked recoil smashed the butt
into the throttle quadrant.

Now why the hell didn't Robinson make their aircraft shotgun proof!!!

They are out there Steve!

That's one for the record books! Thanks!

From: Chris Davis <cdavis@ptel.net>
Message-ID: <01bb78df.a04f1cc0$075c09ce@chris>
Source record: 197186

I've posted a question about this before, but I think I'm narrowing it down...

My HT (Kenwood TR-2600A) acts like it's overheating, but it is not noticeably warm. In fact, today it sat in my van (not in direct sunlight) and would not work (as if it were overheated). It was only about 85 degrees in the van. Does this thing have some sort of thermistor that shuts it down when it reaches a specific temperature, and is it possible that it is shutting down at too low of a temp?

Thanks

Sharp eyes, Jeff. No, I didn't write the above. Back when I was a
Novice (63), we weren't allowed VFO operation. My first Novice rig
had other problems (got a warning for "rough note") but it was
crystal controlled. Later, (several years later) I got an ARC-5
carcass at a swap meet and used the nice variable capacitor and
gear drive for another project (a FET VFO for a homebrew DSBSC
rig).

Hi Gary!

You'r right - we all really build upon that which has been done before us. I guess my "problem" has to do with the basic definition of the hobby - ham radio.

HR, tho, today is not just radio anymore. It includes many other disciplines so I accept the diversity in the hobby that exists now. I guess I was just reflecting on one aspect of the game as it was for me more than 40 years ago. Hopefully it is as challenging and fun for the youth of today.

Regards,

Dick w7wkr

Mobile 2-meter amateur radio for sale. This transceiver is in "almost new" condition. Here are the details:

- Radio Shack model HTX-212
- R/S price is $260 (plus tax).
- built-in CTCSS encode AND decode
- 30 memories + calling channel
- 6 DTMF memories
- Two VFOs
- DTMF microphone with direct entry for frequency
- 45/10 W output
- out-of-band receive (136-174MHz), MARS/CAP capability
- DTMF paging
- 1200/9600 baud packet capability with instructions in manual
- Inter-mod rejection > 103dB
- original box, manual, reference card, all accessories
- under 6 mo old

I changed my mind and want a dual band HT instead! The wife said I had to sell something first!

Price: $200 (no tax). I'll pay UPS ground shipping. U.S. sales only. I live in north-central Indiana.

>Thanks much,
>Jeff, KD6DHB

Jeff, your local Radio Shack store should be able to get you this info.
Give them a phone call and inquire. They're usually pretty helpful on
getting manuals, instructions, etc (in my experience, anyway).

Hi Bill - Yes it has been many years since we met and chatted "back East". Was an interesting gathering with all those spread-spectrum folks. Lots of talent there. I sort of lost interest in the project once we lost the possibility of using the ss on 50MHz.

Another reason for not remaining active was that I started building a retirement house in a very remote area of north-central Washington and ALL ham radio activities were terminated. The house is now almost done (year 12) and I am finding more time to get on-the-air and build things again.

You have been busy too - new book and consulting! Hope all are healthy in your family...

73 es tnx for note.

1333. New ham looking for recommendations for 2m/70cm HT

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-23 00:00:00 UTC
From: efricha@tigger.cs.Colorado.EDU
Message-ID: <4t3m9v$4ub@lace.colorado.edu>
Source record: 197343

Greetings all...

I expect to pass the Tech test this coming Saturday, and will want to purchase a rig as soon as possible after that. Given the prices I see for equipment, it looks like I'll start out with a HT as my only radio for a while.

So, I'm looking for somthing that is:

o Rugged -- will go on hiking trips
o capable of 5w output
o Generally the sort of thing you could live with as your only radio.
o Batteries can be recharged from a cig ltr. plug while in the radio.
(As an aside, is it reasonable to consider using a handheld with a mag. mount antenna in a car on a more-or-less continuous basis? Will the cables be an annoyance? Is the antenna connector going to hold up?)

Any recommendations? (for OR against certain choices)
My current choices are: Kenwood TH79A(D)-HP or Yaesu FT-530. Any others I should be considering?

Thanks Much,

Eric F. Richards

: -Mark

They are correct!! Unless somethingg is done the amateur freqs. will be lost.
When is the last time you have provided public service or encouraged
somebody to take a license exam? (Rhetorical question). Have you taught
a license class? Visted an elementary or other school classroom?

Instead of just complaining about losing market we hams should take responsibility and
justify our existence. Remember this is the amateur SERVICE. That is
the reason that we exist.

Kenwood is probably much closer to the amateur market than the average ham.
Since their livelyhood depends upon it (partly). If they want to sell
their equipment in more accessible locations good for them. Will it
contribute to the demise of amateur radio? I doubt it. As hams we need to
police our bands and take care of ourselves. This is our only defense against
poor operating practices. Sitting around and talking about the good old days
and complaining about no-coders does nothing for the longevity of the service.

Want to keep people out? Make the theory portion of the exam more authentic.
Make sure people have to know something to pass the exam. Keeping the code for this reason
is not helpful; it does nothing to contribute to the building
of an experienced pool of operators. Times change, now we need to change.

This radio was made for the domestic (Japanese) marked ... I have seen it advertised, in times gone by, in the Japanese magazine "CQ Ham Radio".

It was never destined for overseas markets, and there is no modification for US bandplans.

73, and good luck!

I'll betcha that if you contact Yaesu, they could mail (or even fax) you a copy ...
their telephone number is 310 404 2700, and their fax number is 310 404 4282.

Without getting into all the brouhaha about why you want a caller-id blocker, there are many good resons.

You need to tell your modem not to look or wait for a dial tone. If the software you use doesn't have this option then it can be set with modem initialization commands (you know the ones that start with AT). Some modems refer to this as "blind dialing." You probably will still need the commas to cause a delay before dialing.

From: Scott Macmillan <scott@golfmike>
Message-ID: <zWW01JAZ+A9xEwTO@golfmike>
Source record: 197364

Hello, and thanks for your time.
A radio friend of mine has just bought an Icom IC240,
2 meter FM transceiver with a super scan fitted.

The radio has developed a fault with the super scan.
It will scan OK, but when it stops on an active frequency
the channel displayed is not the one the stations are actually
operating on. I have went through every frequency on the radio
with the super scan off, and the channels are on the correct
frequency. i.e. S 20 = 145.500, S 22 = 145.550 etc.

Has anyone came across this fault before?

Does anyone have a schematic diagram for this radio, and
the super scan unit that the they would copy for him?
Costs for copying and mailing repaid of course.

Thanks in advance DE Scott - GM7OMU.

Yeah, right a Saber is most definitely in EVERY amatuers price range. It
may be the ULTIMATE PENIS EXTENDER for the discriminating ham operator.
Grossly over priced and when breaks it which is very common its fun to
fix. AND since Motorola has gotten goofy about the "software "(which you
can still secretly get from almost Moto employee in the Chicago area) with
the "secret Moto Police" at hamfests it makes a even more exciting radio
to own. IF you like PISSING away
your hard earned bucks...GO SABER....better yet go SYSTEM SABER and have
fun on the amateur band with SECURENET like all the geeks do here in
Chicago...

You can NOT beat a GOOD grossly over priced Motorola SABER....They
suckered the fed's with em via the GROSSLY inflated prices so why not the
wide eyed amateur market. STATUS symbol folks....SUCKERS!!!!!!!!!!!!!!
One born every minute..... Oh yeah NOT to mention the
"sting" going on over some Moto crud,,like SABERS
etc.....BEWARE.....

I DON'T KNOW WHAT HAPPENED WHEN I ATTEMPTED TO POST THIS REPLY THE FIRST TIME!?

Here it is again, I downloaded it and reformatted it--I hope it works!

I had an RCI-2950 a few years ago. The mod to make it work on CB requires changing the positions of some internal jumpers. Since you are already able to get CB, seems that this was already done! To switch from CB to ham operation, hit the *LOCK* button.

From my notes, there are three jumpers mounted behind the display. With the top cover off, looking at the back of the display board, they are, from right to left:

1) ROGER BEEP/Ch9: Jumper located just left of resistor(?) RA604.
>Jumping bottom two pins maps the roger beep on/off switch to *ROGER BEEP* button.
>Jumping the upper two makes it a ch9 priority button.
2) RX/TX RANGE: To the right is a jumper block labelled S601.
>Jumping leftmost two pins gives a range of 28 to 29.7MHz
>Jumping rightmost two gives a range of 26 to 32MHz.
3) CB/10M SWITCH: At the extreme right side of the back of the display panel, just right of RA610 is a jumper block that controls the mapping of the *LOCK* button.
>Jumping the top two pins together makes the LOCK button toggle between CB and 10m.
>Jumping the bottom two makes it a VFO lock switch.
(If you can't switch back to 10m, it might be because this switch has not been remapped.)

DO NOT MAKE THESE MODS UNLESS THEY ARE LEGAL WHERE YOU LIVE!
(The 2950 is not type approved for CB use in the US!)

As for storing repeater offsets, I really don't remember, sorry. But I'm certain that there is a way of storing them--call RCI.

Also, a word of caution: Make sure you don't put more than 13.8V into the radio: The caps inside are rated 16V--and they *DO* pop!

1364. Yaesu FT-50R and ADMS-1c Software Down Loading To Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-24 00:00:00 UTC
From: John Stinson <jstinson@planet.eon.net>
Message-ID: <01bb7955.818e7a80$fadcb9c7@default>
Source record: 197198

IMPORTANT INFORMATION ON USING ADMS-1C SOFTWARE (NOT DOCUMENTED)

When using software to send information to your radio pay close attention
to the following:
I will try to keep it as simple as possible.
A. When the program makes a template of your radio keep basic at first.
Name it noname.rdf to start. You can change it later.
B. After you have made your freq. and etc. enteries in the program and are
ready to transfer them to the radio follow my instructions and I hope you
will not have the trouble I ran into.
1. First click on memory.
2. Click on merge from.
3. Radio file for merge select noname.rdf.
4. Click on Radio.
5. Click on Send Data To.
6. Follow instructions on starting FT-50R. Make sure the following steps
take place:
i. Template File_Box Does not have a X in it.
ii. You are using noname.rdf template.
iii. You must understand that while the word WAIT is on your radios
display you can not remove the link cable. If something goes wrong retry
until you see CERR then turn the radio off. You can then safely remove
the link cable and try again.
7. Now click on OK. Lots of luck I hope you have a successful transfer.
But remember not to remove the link cable while the radio is on.

If Kenwood is so determined to sell anywhere and attempt to undermine
U.S. Amateurs, They had BETTER be required to post signs stating "FCC
TESTING and LICENSE REQUIRED." The FCC requires us to test before
aquiring an Amateur License. In my area of Colorado, we Amateurs ARE
VERY active in ARES/RACES, and would take "Shotgun" offense to
unlicensed operators.

Ten-Tec is the obvious one. Ramsey sells US-made kits, as do many other smaller companies. Index Labs sells a nice US-made QRP rig. Drake still sells US-made shortwave receivers but not ham gear. Radio Shack sells ham gear which is not US-made, but Tandy Corp. (Radio Shack's parent company) is US-owned. There may be others too.

I run 2 meter, HF mobile, and CB in my Sable Wagon, I have a bug catcher on my trailor hitch, 2 meter on the front of the top, and cb in the middle with a cell phone antenna added in. I seldom talk on the CB, but monitor most of the time I'm on interstates. I am amazed how often when I pass a group of trucks I hear one or more say "Hey ham, turn your 2 meter on 146.52. I do, and they call me, and we have a nice simplex conversation, these are licensed hams, not bootleggers. I hear several conversations about getting the no code license and a few about getting General on the CB by the truckers. They see 2 meter simplex as a more private channel. I have never heard them talk about getting the radio and not the license. I see this as another avenue of getting more hams, and increasing the usage of 2 meters, which on the open road is almost totally quiet.

I am amazed that you assume all truck drivers will buy and operate the rigs without licenses. They know how easy the no-code test is, and how much grief they get from even their own ranks if they are not legit.

Since Kenwood doesn't sell an inexpensive 10 meter rig, where most of the bootlegging takes place, I don't think they will replace Uniden in that area.

We need more utilization of the 2m and 440 bands. The reason I have a Radio Shack HTX-100, 2 - Radio Shack HTX-202 and 1 - Radio Shack HTX-212 is that I like to buy locally, and beleive it or not here in Houston, Texas I cannot buy locally. There is one small Ham Radio Store about 1 hour from me, with a very limited inventory. The only thing I have ever bought mail order was the Ten-Tec 555 since they deal only in Mail Order.

If a local truck stop carried Kenwood there is a much greater chance I would buy Kenwood.

Personally if they are having market problems I would rather them team with a high end electronics superstore like Circuit City or Incredible Universe than truck stops, but think of the number of non hams that frequent those stores.

|> each his/her own :-)
|> Bob WB0POQ

I'll second that. In fact, one need not have the determination of the original poster to build a useful piece of gear that doesn't cost an arm and a leg. There are many excellent QRP kits available these days (Wilderness Radio, Small Wonder Labs, Oak Hills Research, S&S, and soon to be Ten-Tec ...just to name a few). These guys make good solid radios in the 1 - 5 W range, with receivers as good as the commercial gear costing thousands. Most of these manufactures make single band kits in the $60-$200 range with very comprehensive instructions (some on par with Heathkit).

On bands like 40M and 30M a couple of watts even during a sunspot low can do wonders. Remember, the electrons don't know whether they are coming out of a $100 or a $2000 radio, and if you have a good clean signal the guy at the other end isn't going to know either. So if you haven't tried building, give it a shot .. it's not rocket science! Start out with something small like maybe a keyer kit, or an audio filter and maybe you'll discover a whole part of the hobby that brings you enjoyment. Remember, it is JUST a hobby.

1380. ? re. Sangean 818-CS 'Beat out' switch

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-24 00:00:00 UTC
From: Michael Olsen <glassguy@lamar.ColoState.EDU>
Message-ID: <Pine.A32.3.91.960724102306.72388A-100000@lamar.ColoState.EDU>
Source record: 197214
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

Hello all,

I have recently purchased a Sangean 818-CS, and am quite happy with its construction/features/performance, but I have a question concerning the function of a slider switch on its left side. It's labled 'BEAT OUT' and the options are '1' or '2'. The manual makes absolutely no mention of its function, and I can discern absolutely *no* difference when it's in either position, on any band, or with BFO on or off.

My guess is that it selects between upper and lower SSB (as there is no other selector switch for this), but when listening to a SSB xmission and switching between 1 and 2, there is no difference. I'm wondering if the switch is then *broken*.

If you know what this switch does, please let me know by *personal email* as I am not a regular reader of this group. You might want to post your answer/guess to the group too, though :)

TIA,

Michael Olsen

I ordered a FT50 R today from a dealer in London.
He said did I want it modified, I said yes and then he asked which mod did I want? He said they were available with 2 options:
Wide band RX
Wide band RX and TX.
I ordered the wide band RX and TX. It will arrive 25.7.96. I will post the findings in this newsgroup after about a week of testing.
Incidentally, the ADMS software is not available in UK at present...I guess the first batch must hav sold out.

By all means, buy the R7000 if you are goinf to use this. I have the R7
and while it works, the design is fairly complicated. The r7000 seems
much simpler (trap design, enclosed parts, etc). As of now, they are the
same price. I have mine roof mounted and it is very comparable to my
Carolina WIndow except that it is not very broad-banded. You will need a
tuner for parts of 40 meters.

> Shel WA2UBK

According to the info leaflet I received when I purchased the FT-50R, the FNB-41 battery pack has 8 cells. At full charge, it should have 9.6 volts, and at full DIScharge, it says 8 volts. Charge current is 50ma. for 15 hours. It's rated capicity is 600mAh. Hope this answers your FNB-41 question.

Source record: 197278

I have an FT-51. My problem is that the tuning knob on top is
always falling off. At first it was just the rubber covering. I
glued it back on with RTV a few times. Finally, after two attempts

with a type of "superglue," it held, though its a little stiff...
Now the *plastic* part of the knob to which the rubber covering is
glued is slipping off--oh, well!

Regarding the PPT cover, it shouldn't fall off. It is a part of a
continuous molding that forms the water-resistant gasket. If it
comes off, then it must be torn from the rest of the gasket.

> the performance is with the TS-850 vs the TS-450. What are the major
> differences? Tell me what you know.... How's the sound difference?
> Receive ability?? Tell me all you know!

These are not all,but ...

TS-450/TS-850

RF BPF Not Narrow / Narrow on 7MHz,14MHz,21MHz

1st IF MCF 2 poles x 1 / 2 poles x 2

8.83MHz Filter 2 poles / 6 or 8 poles

Notch AF Notch / IF Notch

Slope Tune NONE / IF Slope Tune

Proc. AF / IF

Side Tone Fixed / same as pitch freq.

Keyer None / Built in

etc...

I think 850 is much better on lower band RX.

SGC is US owned and manufactures ham gear (antenna tuners, amplifiers and SSB transceivers) in the US. The equipment they manufacture is also type accepted for maritime and aviation use but it is marketed to the ham community.

1404. Electric fuel pump causing noise? -Reply

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-24 00:00:00 UTC
From: rrdunbar@fsd.COM
Message-ID: <s1f649a4.028@wpoffice_smtp>
Source record: 197288

Earl, I believe you've diagnosed it righ on the head! I've been fighting a 'starting/ignition' problem just recently, so I recognized your symptom right away... the fuel pump starts immediately and precharges the fuel system, then stops until a pressure drop signals a call for more fuel!

I'd suggest a 3 level approach, each getting more difficult:

A. First, establish a standard 'set of conditions' ...
- all doors closed
- nothing on but the 6M radio and the ignition
- parked in a particular location with nothing close to the car
- REMEMBER to be careful around gasoline!!! No sparks or fire!!!

1. Try a good quality 0.1uF (at least 100V) directly across the pump
2. Try a 0.1 and 470pf 100V from EACH lead to nearby GOOD chassis
3. Add a small ferrite with a few turns of wire in series with EACH lead to the fuel pump. The caps previously installed should be on the fuel pump side of the inductors.
4. Trade cars.

Good luck, and pls let me know how it goes...

> or bad?? Tnx! David.

All I can relate with ICOM is my experience with their IC-2350H mobil
rig, and that experience has not been good. I am unable to get
technical support through the Internet without belonging to CompuServe,
they don't offer an 800 number for it, and they haven't responded to
mail I sent them for a problem I have with the rig, namely that there is
no way to defeat the full duplex function and mute the subband receiver
during transmit. My dealer says there is no fix.
My advice for now ? Avoid ICOM unless and until you feel they are
capable of supporting the unit in the way you need it supported.

Well... here goes... I'm gonna put in my $.02 worth.

What "kind" of marketing are we discussing here? Where is it written that any manufacturer has the obligation to "check out" the qualifications of any purchaser of any of its products? In the absence of a law (e.g., the Brady Bill), Kenwood is under no obligation to perform this check. Do you want your personal freedoms further controlled by the federal government? Has there ever been an instance where federal regulation at the point of sale has had any benefit? Why should we task Kenwood with that responsibility? If unlicensed operators obtain amateur radio equipment, they are "scofflaws", just as anyone who speeds on the highway (you and me?). I, for one, would prefer a much more aggressive effort on the part of "our" FCC to prosecute the scofflaws, instead of a "license check" program supervised by the government. 73, KB7ET

This is an interesting thread......

Things have changed drastically in the last 20 - 30 years. I remember that the best place to find good stuff was at the army or electronic surplus store. There were no fleamarkets or hamfests to speak of. You had to scrounge around for parts unless you were rich. I rememebr being delighted to get a pair of 6146 pulls in trade for a used 6L6. Every part was valuable. You or a buddy could fix just about any technical difficulty - the idea of sending it back to the factory was unknown except for the odd Collins snob who would do just that every year (at least so he said!) for alignment and inspection. Things were not so competitive as they are now. Many fewer contests. I knew all the ARRL DXCC countries. You hadda learn the Code whether you liked it or not. You sent to the FCC for your test.

Maybe that's why I like Boatanchors..........

Hi all. I was wondering if anyone knew where I could get some information on a couple of Heathkit rigs that I have acquired. One is an SB-300 receiver. The other does not have the label with the model on it because it came off, so I do not know which it is. I DO know that it contains a transmitter, and I am guessing from its appearance that it is the transmitter that makes up the transmitter-receiver pair with the other radio. If anyone has any information as to where I might be able to get manuals for these two radios, as well as any cables (I have NO cables with either one of them!), I would greatly appreciate it. Thanks in advance.

Hi all
I just hooked up my new Icom IC-281h 2M mobile, and I have a few questions.

1) The manual leads me to believe that Tone Squelch is included in the US version. I can ENcode PL tones, but the rig won't DEcode them (I.E. I can't get ' T SQ ' to appear by following the directions).

2) Is there any way to monitor a priority memory channel while in MEMORY mode w/o transferring the freq. to the VFO each time I switch channels?

3) I know that these '9600 ready' synthesized mobile radios are not supposed to be too good at 9600, but I was curious if anyone had successfully used an IC-281 at 9600. If so, any comments/advice?

It would be helpful if responses could be emailed as well as posted if possible.

Thanks & 73

>Jeff, KD6DHB

You are correct, however the "self-policing" aspect of the Amateur
Radio Service is intended to be more of a peer-to-peer (with other
Amateurs) type of policing. As Amateurs we are not allowed to
"inform" bootleggers of the error of their ways without also breaking
any number of rules.

This isn't the same as triangulating someone on your local two-meter
repeater. The bootlegger on HF could be thousands of miles away!
Amateurs are not given the authority to be "radio police", and the FCC
doesn't seem to have this type of problem anywhere NEAR the top of
their "to-do" list.

Kenwood could be doing more to create additional marketing
opportunities than selling Ham HF rigs at truck stops. I don't think
my involvement or active participation in ANYTHING will help offset
the potential damage this kind of marketing can bring.

If this is all the manufacturers can come up with, we may very well
lose our ham bands, but for very different reasons than you cite!

I pretty much agree with all you say about improving the service Jeff.

BUT... what does any of this have to do with a marketing strategy that any reasonable and knowledgable person would have to admit is likely to incur a large number of sales to UNLICENSED persons. Yes I have heard of sales to unlicensed people from "legitimate" ham-radio stores. And well, nothing is perfect, but the issue now is Kenwoods strategy will provide greatly increased accessability to ham band radios to ANYONE, licensed or not. They would not do this if it were not true. Their sole goal is to increase sales. And add to that, I believe that Kenwood's "new sales outlets" are most likely run by individuals that are below average in concern for the law or regulations. An old adage on the highway is that "You can get anything you want at a truckstop, just ask around."

You mention that hams need to police the bands and take care of ourselves. Well with absolutely no power ourselves and an FCC that can't or won't help us we are having a hard enough time as it is. What are we going to do with the large number of illegal operators that WILL be on the air due to Kenwood's doing?

So what Kenwood is doing is essentially saying "f**ck you" to their licensed customers. We don't give a damn about the problems on the bands caused by our sales. They are behaving as any "good" company should. They operate purely in the profit mode. Sales and dollars and yen is all that matters to them.

But what I would like to see is a concerted effort by licensed amateurs to make a clear statement to Kenwood. That if Kenwood does not give a damn about us, then they will loose sales, dollars, yen since we don't want to do business with a company that clearly couldn't care less about its customers after the sale.

Yes we need some change and improvement, but simply turning the bands into an unlicensed free-for-all is no the answer.

Dave,

The CTCSS decode does require an optional board (Model UT-85). It plugs
in and doesn't require any adjustment.

I am using mine for 9600 baud and have no complaints at all. The data
doesn't look as solid on a monitor as a crystal rig, but still seems to
work fine.

I haven't used the priority monitor so I wouldn't be much help with it.

Yo Moe. Assuming a decent antenna and transceiver, propagation is the
key word in hurling your signal to the far reaches of the earth.

Take a look at the following URLs

HAD a Z1 and sold it to buy a FT51 - love the 51, also have the FT50. The ONLY advantage the Z1 has over the FT50 is being able to listen to two bands at the same time (some folks don't think this is an advantage).

Audio on transmit on the Z1 was poor, the audio on RCV on the Z1 was terrible. Most unusual for ICOM, but that was my experinece and the experience of a couple of other hams locally (all of whom have sold the Z1).

Personal opinion, I like the FT50 as a dual band scanner/transceiver and I like the FT51 as a dual band transceiver/scanner.

Hello !!

I have found in ftp.funet.fi the radio mods for Kenwood TH79 to operate
packet a 9600 bps, but theses mods are in Germany !!

Do you have/Do you know where can I found this modification in English
or Spanish ???

Any comments are welcome...

1430. Question on new KWD TM-241A

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-25 00:00:00 UTC
From: n8mwz@alpha.wcoil.com
Message-ID: <4t73le$l4n@tofu.alt.net>
Source record: 197126

My brand new Kenwood TM241A does not seem to go above 147.995 MHz
even though an older advertisiment lists the frequency coverage (at
that time) as 118 - 174MHz. I still can go down to 118MHz, but the
VFO mode stops when I get to 147.995 and trying to go higher just
forces it to 118.000. Is this a design change made recently to
combat interference from pagers and stuff? The owners booklet
is next to worthless and lists the coverage as 144-148MHz.
I am not in a mtropolitan area and it would be more useful for me
to have NOAA wetaher radio and a few other higher frequencies
than increased IM rejection. Obviously, the next guy might be an
opposite case than mine.

Also, I am not near an airport, but is using and FM receiver on
the aircraft band acceptable to reception or does the Kenwood
switch to AM at those lower frequencies?

Are there any other non-documented options availble for this radio
like a memory expansion chip to get more than the stock 20 memory
channels? I am just curious. I guess I could have bought a radio
with additional features instead, but am just curious about what all
else Kenwood didn't tell me in the booklet.

Thanks for advance for any email responses to <n8mwz@amsat.org>

I use the ADMS software to program my ft-51r and it works fine in Windows
3.1 native and under OS/2 (with some special settings).
However, I want to try EZ-Clone because: 1.) it has a native OS/2 version and
2.) the data files EZ-CLone produces are ASCII text files (and editable as such
by ASCII text editors) whereas ADMS data files are in a proprietary format.

ARC-5 ? Yup, I even have one in new condition sitting on my parts shelf.

Got my first ticket in the earily 60's (WA4AME). My first rig was a Heathkit Twoer (looked like a lunckbox). I had a Halo on the back of my Dad's car and used a mobil power supply to use the Twoer while we went on trips.

Let my license expire in the earily 70's then got back into it in the late 80's (KB4BJO). Just got my old call back under the vanity callsign program.

I loved all the old stuff. I too ground my own crystals and built my own receivers and antenna's.

I still have ton's of old parts (germanium diodes and rectifiers (remember the ones with all the plates), coils, rotary inductors, coil winding machines, etc).

I'm all for an oldtimers news group.

Anyways, it was nice remembering......

In mine it destroyed a chip capacitor in the relay switching circuit for
the filters, locking the 50 MHz filter on all the time. I put a larger
chip in mine, and mine is now OK from 1.5 through 54 MHz.

This failure in my rig showed up as full power on 50 MHz, and less power
as frequency was reduced. I got only 5 or ten watts on 30 MHz, and almost
nothing on 160.

I can not say if yours was the same.

I have been pleased with mine. Only problem I noticed was the speaker
is not really good for loud areas. It is a bit distorted at high
volume.

What features would you like to know more about?
Also, this radio was discontinued by ICOM after July. How much does
it cost now?

Thanks to all for responding to my querry!

Following are the answers received in the last day, many of which were
emailed and not posted to the group.

Your feedback is great!

Thanks again,

Michael Olsen

The answers:

It's a beat-frequency switch. Without going into detail, it's
basically used on the AM BC bands if you start hearing signals
hetrodyning together. One of the alternate positions may reduce
the irritating noises. :-)

- Rich
***

Does this receiver include an audio cassette recorder?

I had an AM/FM portable that used a switch to change the frequency of the
cassette recorder's bias oscillator. Bias is a high frequency signal that
is added to the record head current to make the tape's response more linear.
If you are recording and listening to AM the bias oscillator can generate
frequencies that can make the AM radio squeal. This switch gives you a
slightly different frequency to move the squeal away from the desired signal.
If you are listening to FM you can use either setting.

Patrick A. Thompson
transmitter supervisor WBIR-TV
amateur radio WA4TUK
***

I think this is included on the "CS" version because of the cassette
recorder feature. All tape recorders have bias oscillators that
opperate at about 40 - 100 kHz. These oscillators produce harmonics of
their fundamental frequency that can cause a "beat" on the station
that you are recording. This switch lets you choose between two
different bias frequencies to avoid interference when recording. The
bias frequency doesn't have to be precise to achieve its purpose of
reducing tape hiss and improving frequency response of the recording.

All the best,

Al
***

The switch is "BEAT CUT", not "BEAT OUT". It's used on the a-m band
to eliminate the "whistle" of heterodynes from competing stations on
the same frequency. Might also have some effect when listening to
SW stations. It will have no effect when the BFO is on. There is
nothing wrong with your receiver.

I've got that radio also. the "beat-cut" switch
doesn't do much on mine (as far as I can tell)
either. I know my manual makes reference to it. I'll look it up
this weekend. Also I have a mod that eliminates the muted
sound during tuning , making the radio sound like an analog tuner.
Makes searching for weak stations faster. I'll look for that also.
I'll let you know what I find.
-Mike

1453. IC-706 crash if TX on 31 Mhz ?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-25 00:00:00 UTC
From: ea4abb@linux.ea4abb.ampr.ORG
Message-ID: <Pine.LNX.3.91.960725141235.1732B-100000@linux.ea4abb.ampr.org>
Source record: 197234

Hello !!

I have had the same problem with 2 IC-706...

When I tried to transmit on 31-32 Mhz where some phones works, only
pushing PTT one second the transceiver output change form 100 W 10 W and I
had to send the radio to repair it...

On 31 Mhz i do not have a good antenna for this qrg, but I suppose the
SWR protection of the IC-706 is here to prevent any problem..

It is like if the SWR PROTECT hang-up and cannot be unlocked...

Any comments are welcome...

Source record: 197235

I think an Old Timers news group would be great. I originally got my license in 1953 when I was in high school, but was never active and let it lapse. I recently got another license and through the vanity call system was able to get my old call sign back.

1461. What wattmeter: Telewave 44A or Bird 43

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-25 00:00:00 UTC
From: Tracy Hooker <thooker@psl.nmsu.edu>
Message-ID: <31F7CAC9.7710@psl.nmsu.edu>
Source record: 197242

I am looking into purchasing a nice, accurate watt meter. I am considering the Bird 43 (with several slugs) or the Telewave 44A. The 44A has the advantage of not needing slugs, but still works over 5 to 500 watts and 20 to 1000MHz. The Bird may be more accurate using it's thermal method (I don't know if the 44a uses thermal or not).

Please let me know your experiences...

Tracy

Yes I do
Radio was fun and so were the people that you talked to.
The repairing of radio or other electronics equiptment and not having 200 to 450 volts jumping out and licking your hand as your eyes roll back. The fun of the hunt to find drawings and info on a radio. Talking on 80 meters with 75 to 300 watts and the quality sound of AM. You fixed everything.Now you get a high tek piece of crap out of a box. Looks good lasts a year or so then a newer one comes out and it starts again. Hell if it go bad just buy a new one there cheep .People do not keep things long, whats new is in and that seems to be the reason that we are so screwed up. The thought of having a radio that is 20 years old, are you out of your mind. Hell just buy a new one and keep yourself in debt.The radio gear may have been big, heavy and old. But it did last years and was a lot more fun. For the most part Quality and pride, whats that. Like I say "Maybe thats why we are so screwed up"

Well, its a week or so after I posted a question and the lack of
any answer makes me wonder if the fellow should get sued.

I ask my question again ...

Is there any rock solid evidence that the SBE and ARRL are opposed
to any particular issue? By "rock solid" I mean something like a
comment on a rulemaking from the SBE that would be contrary to an
ARRL position on the issue. Or maybe a SBE article that expounds
a position that is obviously anti-amateur radio.

Is the SBE for taking away 40 meters from the amateurs? Perhaps they
want two meters?

Anyone??? Something I can get a copy of ... a magazine article ...
something??? KG7FU???

I had the same problem with my TS440S, and know
others who have it as well. I tried injecting
contact cleaner into the keypad subassembly, but it
did not help much. The final solution was to buy a
new keypad subassembly (~$85 as I recall). It was

pretty straigntforward to install and has been
working fine for the last several years.

This switch changes the cassette recorder's bias oscillator frequency slightly
so that it doesn't interfere with AM stations you are recording. It should
have no effect on FM reception and the squeal the bias oscillator can produce
on AM stations should decrease with an increase in receive frequency.

It's a beat-frequency switch. Without going into detail, it's
basically used on the AM BC bands if you start hearing signals
hetrodyning together. One of the alternate positions may reduce
the irritating noises. :-)

it all depends on how you hold your toung moe, when you plug it up. And
as to where you insert the plug too. If you feed it a kilo watt your
neighbor should be able to hear you, if you run it horizontal at ground
level. as to the speed i dont know if i can improve much on the speed of
light... however if you run your thing a ma jig in a vacume you will
imporve the speed factor by a ratio of 1.12343765896 to 1 . with this
improvement your signal will be the first one to the receiving antenna
thereby allowing you first bid on the listners ear. hope this helps moe

>Pam/N3XVP

Recognizing that you need a transceiver to use the transverter, It all depends on the transceivers. In general, you will be happier using a 6-meter tranceiver. There is also the hassle of cabling, power supplies, etc. If you already have a good low band transceiver, and can find a quality transverter at a good price, give it a shot.

1485. Kenwood TS-180-S Ext VFO Probs

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-25 00:00:00 UTC
From: "William M. Bickley KF2ON" <wbickle@ix.netcom.com>
Message-ID: <31F7B4AD.3B6F@ix.netcom.com>
Source record: 197266

After recently acquiring a used VFO-180 external VFO for a ham friend in Italy, he now advises that the unit
seems not to be working properly. There are no apparent problems with bands other than 20M and 40M, but on
these two bands the display is blank. Language is a bit of a problem here, so there could be some simple thing
he needs to do, but from this distance and without the equipment, I'm no help.

Any suggestions from folks familiar with this equipment would be much appreciated.

TIA, and 73.

Bill KF2ON

1495. Tri Band HT?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-26 00:00:00 UTC
From: John Reed <jreed@ilinks.net>
Message-ID: <31F971C8.788F@ilinks.net>
Source record: 197069

Is anyone ever going to make a Tri-band HT that does 2,440, and 220?

Or how about 6,2,70cm? (That'll probably come before the other).

I've been waiting for one of these for years, and have never found one... Icom made that delta 1 thing... I was hoping for a delta 2 or something with the above bands. ..

Anyone got any ideas? Is any of this even in the design stages?

73 de John

To get any heathkit manuals you can write Heath located in Benton Harbor MI
the cost is reasonable and the service is good.
To turn off the sidetone osc in yhe HW-16 you can disconnect the neon bulb
located at the right rear side of the rig on top of the chassis.
The sidetone in this rig is a relaxiation oscillator type and requires the
neon bulb to function.
Good luck with the HW-16,nice little rig,I like mine a lot.

I have a 1993 Chevrolet Cavalier with a drifting up and down the band on 6-Meters Birdie. It seems to drift up and down with no rhyme or reason. It can even be found while just turnng the key to "ON" while the engine is OFF!. There is a 10-Amp fuse which when removed from the fuse box removes the noise but I don't know what is on this circuit. I have another friend with this problem in a Chevy Van and another with a Blazer and the same Damn Noise. Anyone got a clue?
Thanks,
Mike

Hello I am looking to trad a Digital Equipmetn Microvax II for Ham gear -

I am looking for HF transcievers (prefer digital/solid state - but will consider all) or a 10M mobile rig. Also any other interesting swaps - or of course $$ (cash)

Here's the latest set of specs I am sending people about the MV II
(will guarantee against DOA, and YES the unit can be shipped UPS in 2 boxes.)

Microvax II CPU KA-630
BA-23 cabinet (DeskSide - Pedistal style)
5M RAM MS-630-aa & BB
4-port Serial Card DZQ11-M
1-Tk-50 tape drive (95 MB)
1-RD-54 drive installed, (159 Mb)
1 spare RD-54 (159 MB)
1 RD-53 (71 MB)

VAX/VMS V 5.5-2
VAX 'C'
VAX BASIC
CMU TCP/IP services for VAX/VMS

a couple of tk-50 tape cartriges for backups

Also I have a VT-320 & 3 spare Keyboards that can be included if needed.

Date: 1996-07-26 00:00:00 UTC
From: aak@olympus.net
Message-ID: <aak-2607960638180001@papm017.olympus.net>
Source record: 197082

I have the following for sale:

A Tripp-Lite precision regulated DC power supply. It converts 117 Volt AC power into regulated 13.8 Volt DC power.

The specifications on it say:

Precision Regulated DC Power Supply Model: PR-7 b
Output: 13.8 Volt DC 7 Amp
Input: 117 Volt AC 60 Hz
Fuse Protected
Low Ripple Fully Regulated
Electronic Overload Protection with an Instant Automatic Reset
---
It is brand new and still in the original box. It comes with the original instructions. This is good for ham radio operators or any others that operate equipment that requires the use of regulated DC power. Delivered priority mail right to your door. Asking $100. Negotiable.

Thanks
Tony Korolis

The TS-450S, and virtually all other current HF tranceivers, are modifiable for use on frequencies allocated to Military Auxiliary Radio Service (M.A.R.S.) licensees.

If you provide a copy of your M.A.R.S. license to either the manufacturer, or to the dealer you bought the radio from, they will be more than happy to provide you with the modification information!

Bob,

My 241 goes from 118.000 to 173.999. You need to initialize the VFO. Press and hold the VFO/M>V button while turning the radio on. Press the VFO/M>V button once more, then you can tune the VFO all the way up to 173.999 Mhz.

73 and good luck

Ray

>carrier output power you adjust the carrier level control.

This is a very unreliable method, and it fools most "peak reading"
wattmeters that cannot respond quickly (all the MFJ's and other
analog meters). What happens is that the PEP will "drift"
around and is enormously sensitive to audio input from your mike.
Just normal speech will show the power jumping around all over
the place. You can set it to "5 watts" and in the next 10 seconds
see it jump to 50 watts (using a digital wattmeter).

Turning on the speech processor helps. It levels out the audio
a bit. But it does not keep the power output level from the rig.
It is just too hard to stabilize it without ALC control.

There is a mod out there for changing the carrier control to an
ALC control, but it allows a very high power output at the extreme,
more than I would want to subject my 440 output circuits to.

The simplest and most reliable method is the 9 volt battery,
10 k pot (I believe that will do it fine) and put the negative
into the ALC jack in the back. Adjust the voltage till you get
the desired power via ALC. This actually works.

Regarding the bug with the FTT-12 keypad and clearing the memory in autodialer 9.

I discovered that it's a bug in the MANUAL, not the radio. To clear the memory, simply turn on Function (ie: tap F once), and then hold the top button in for .5 second. It works fine.

I discovered this by accident, as I too was frustrated with the inability to clear the DTMF memory.

>
> I asked that same question, a few years ago, of 2 different guys who
> are in the business of repairing ham radio in their homes. I got
> 2 different answers.

Being very active in the business, I get this sort of question all the time ... I counter it with an analogy - "What's better, Ford cars or General Motors cars?".

If you ask either the original question or my question, all you end up with is a "personal opinion".

You can gather far, far more information by asking a "Negative Question" - "What don't you like about "brand x", and why" ... and you end up with a LOT more information, which you can then plug into your needs/wants/requirements and decide if the answer is really germane to your rationale!

ALL of the radios currently on the market are "good" ... when you start setting out personal requirements, then and only then can you find out what is really "gooder"! There is not a radio on the market that I would hesitate to buy, with my own money, for my own use ... some would fit my needs better than others, but they are all "good" ... the one that most nearly fits my needs is the one that I would call "best", but it would not necessarily be "best" for someone else!

The best way to do any purchase (regardless of whether it's a radio, a car, or a pair of shoes) is to spell out your needs, requirements, and "what would be nice to have in a radio, but I can live without it", and then research using that criteria ... including local amateurs in your research, so you can find out what is really needed in your area!

Good luck, and very 73!

That's highway robbery! Of course, it _IS_ mil-spec, but I
still dont understand how the ham shops in the USA can get
away with charging $1250 for an ICOM 706, when the shops in
Asia are charging about $1000. Same goes for the new Yaesu, which
was quoted at under US$ 800 in Hong Kong. Only difference is
that there might be fewer "standard" accessories with the
Asia version...but surely not $300 worth! Guess there _IS_
a small amount of profit to be made in ham radio!

From: Doug MIles <ko6tx@discover.net>
Message-ID: <31F98156.3128@discover.net>
Source record: 197103

Has anyone experienced the ptt on there ft-50r acting up?
I was chatting on a repeater when all of a sudden I could
not key up the rig? I noticed the battery warning indicator
was on so I thought okay wont key because the battery went
dead. So I replaced with a fresh battery and still could
not key up the radio. I could feel the the ptt switch
clicking but was not keying. So I played with it some
more and found that putting pressure on top of the ptt
button would key the radio (very hard pressure). Well after
a while of my resumed QSO I found the everything was working
fine again?

I have had the radio for about a week and preformed the
mars/cap mod and had to adjust the deviation for both
the vhf & uhf bands. (FYI:my radio stock out of the box had
1khz of deviation on both bands)

I think I will return the radio to HRO becuase if it is
acting up in the first week it is sure to happen again.

Source record: 197104

DEAR FELLOWS:

I own an old Kenwood TS830S and I would like to fix some problems.
But, I don't have service manual and shematics... so, please,
if possible, help me to get the service manual and all schematics
sets. I will pay for copies and shipping to Brazil.

I would like to thanks for help in advance. Please, any reply to
below address/E-mail.

Vy best 73,

You can set the duplex function "VDUP" to transmit on any arbitrary
frequency and receive on another (both freqs in VFOs), but you cannot
do crossband repeat or receive while you are transmitting.

I've had a series of radios in my '92 SL2. An Alinco DR-590 dual band mobile is in it now. Antennas included a 1/4 wave mag mount, a homebrew dual-band antenna and a Diamond dual-band antenna. The antenna is now mounted in a hole through the roof, just above the dome light. Coax is hidden under (above?) the headliner, then along the trim. Power comes from an unused spot in the fuse box.

All radios worked well in the car. I have had no driveability problems or engine speed changes or other symptoms of computer flakiness when transmitting. The only noticeable effect is a small amount of interference with the factory FM radio. Not surprising, given the 3 foot separation between antennas.

Doing a fair comparison (being a Motorola Visar to an FT50), the FT50
is not quite as loud (maybe down 6db), distorts a little more at high
levels, and has equivalent (pretty decent) frequency response.

For the most part, it is about as good as a Motorola Visar for audio.

Howard

FT50 information is available at http://members.gnn.com/hca/ft50

Source record: 197147

I had 2 of these rigs (one with the service manual). Of course now that I've sold the one with the manual, I need some info to do a minor alignment on the rig I still have.

Can anyone out there help? I need to:

Adjust the +/- shift amount (need to increase by 3.5kc)

Retune the rig so that I can transmit above 147.4 without
getting the pll out of lock.

That last one needs some explaining - the rig can now transmit from 144.3 to 147.6. I need it to transmit over a wider area or at least to shift that area so I can hit one of the local repeaters (147.15+)

If I can't get any help I will consider selling the rig - make offer.....

Check out Radio Shack's catalog - they have those notices. You will see
them in the manuals for the radios, too.

They even did this waaaaay back when a license was required on CB....

If Kenwood can't even keep up to Radio Shack's standards then where is
amateur radio heading?

First turn the speech processor OFF (button OUT). Then adjust the Mic
Level control to reduce the peak power output for USB and LSB, or the
modulation depth on AM. Similarly, for adjustment of the CW/FSK/FM/AM
carrier output power you adjust the carrier level control.

I have had a IC-27A since they were new and I have personally never
had a need to use CTCSS in a simplex mode so I wasn't aware of this
limitation. You learn something new every day!

I agree.. the "00.00" offset in Duplex mode is probably an effective
work around, if the radio doesn't interpret this as a command to go to
simplex mode.

Date: 1996-07-26 00:00:00 UTC
From: I�igo Baztarrika <inigo@lander.es>
Message-ID: <31F8CF55.3EED@lander.es>
Source record: 197160

Hello there !
I am interested in TM-255 mods.
Where can I found them ?
Do you you know how to program a higher power ?
My equipment actually gives only 20 watts in HI position.

Answers by e.mail.

Thanks

Iï¿½igo. EB2DTP.

Kenwood TH-27A 2M HT -
Works perfectly
Good condition cosmetically
Original manual
Original owner
Original battery (1.5w) is dead, but see below
Missing small screw on battery release slider (does not affect operation)

Accessories/Extras:
2nd AC Charger
Cigar Power Cord
5 Watt Battery
Larson 10 inch antenna

Asking $200
Buyer pays shipping from Santa Barbara, CA
$25.00 discount for prepayment
References available upon request

Email me at sterman@rain.org

Message-ID: <4taol1$ool@paperboy.alantec.com>
Source record: 197164

Netlanders,

I'm hoping that you can provide some info on your FT50 units as a comparison to mine.

Currently I'm playing with receiving (off air) TV audio. Channel 8 in our area (185.76) come in fairly well, however, when I attempt UHF TV (601MHz +) I get an open carrier pretty much from 590-760MHz.

The carrier remains open until the WSQL is adjust to 8+, even with the antenna removed.

I would appreciate greatly an comments on other units. Direct email would be best to trop@fore.com

Many thanks...

Troy

I asked that same question, a few years ago, of 2 different guys who
are in the business of repairing ham radio in their homes. I got
2 different answers.

So, "Concerning tastes, there is no disputing" (an old Latin saying)
[although each person was supposedly basing his taste on technical
reasons].

I have a limited number of EF Johnson Fleetcom II UHF rigs for sale.

These are easily converted to repeaters. I can provide the unit 2 ways.

As-Is - $50.00 + $10.00 s&h You do all of the conversion, alignment, recrystaling, etc. I will provide instructions for the conversion & a copy of service manual.

Ready-To-Go Repeater $300.00 + $10.00 s&h Fleetcom II converted to repeater use, crystaled to your freqs, tuned and aligned, simple controler w/id. You still need to provide a duplexer, and antenna. w/manual

These units are all pulled from service and tested & aligned on 468mhz.

I also have a limited number of service manuals for older commercial equipment. E-Mial your needs and I'll see what I can do.

Other Services available: (All prices + s&h)

Reprogramming of commercial equipment to Amatuer freqs - $35.00
Equipment Repair - $60.00/hr + parts (1/2 hr min, estimate if repair will take more than 2 hr.)
Custom Cables
'Most anything else your rig might need.

E-mail your needs to:
kproctor@ix.netcom.com

Look at a product from"ART", its a mike-pre, with a 12AX7, cost around
$125.00. It's used in the music business, but will work well with its
60db of gain. Check your local music supply store, Sam Ashe, etc.

1574. FT-50R Fragile Display Window

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-27 00:00:00 UTC
From: aeh@mail.atc.ameritel.com
Message-ID: <71b7cc$13dd.170@NEWS>
Source record: 196926

Oops! I bumped the display window of the FT-50R on the door. Scratched the window. Now what....Would a soft case help prevent this?

Well, when I scratch the wrist watch crystal I use a silk tie to hone out the scratch.

Tried it. It worked! Firm circular motion using fine silk tie (silk is very abrasive, but very fine).

Gotta be more careful with the display face! Not indestructable like the old Icom 2-AT. but a much nicer radio! FT-50R best I've ever used.

Actually, I have done it. I just wish I could remember exactly
what I did.... :)

I think I may have hit function before I pressed the top button for
1/2 second.... Or I may have held function down for 1/2 sec then
pressed the top button for 1/2 sec. But I know I have cleared out
DTMF memory 9.

Now, can anyone tell me why this feature should even be on a radio?
I would think that if you were supposed to have knowledge of codes
sent over the air, you should have gotten them from a legitimate
source, not stealing them from the transmissions..... Just a thought.

The brand of radio is irelevant. What you need is an outside
antenna for the AM signals. No brand of radio can pick up
the weak, attenuated signals inside of metal buildings,
especially signals masked by computer noise, florescent light
hash, etc. An outside antenna is the only reliable solution.
The method of coupling such an antenna to the radio will
vary depending on the make/model of the receiver.

Hi Dave,

I have done some testing with the IC481E (European 70cm version of your
IC281h) and it performed very poorly with 9600bd packet. BBS downloading is
ok, but transmitting long packets produces lots of retry's.

The radio also suffers from very slow tx<>rx turnaround time. IMHO the
radio is NOT 9600 ready.

>published spec, in most instances!

First: I am from a two way radio shop. I make my money by working on VHF and UHF radio equipment. I even do a fair amount of 800/900 Mhz work.

Second: I spend very little time below 144 Mhz. The only time is when I do low band work, meaning 29-54 Mhz range. Don't confuse this with HF, meaning 1.8-30 Mhz. Due to the amount of time I spend in the low band range, it does not pay for me to invest in several different slugs to cover this frequency and power range. What slugs do I need? Well, I need a 100 watt slug, a 250 watt and probably a 500 watt slug for the high power base stations. Do I mention the 5 watt slug for portables? How about the 50 watt slug for the low end underdash radios?

It simply does not make sense to spend that much money for the amount of time and work I have in that frequecy range. This is especially true when I am paying the bills and running the business. I tend to think many technicians are too quick to spend the shop money when they are not looking at the bottom line.

As I stated before, the Telewave meter is pretty much flat in the VHF and up range. Again, why spend all of that money on slugs? I know folks who have three times as much tied up in their Bird kits than I do with my Telewave.

Every example you gave was that of amateur equipment. I am writing about Motorola and General Electric fixed, portable and mobile equipment. Most base stations I work with are 100 watt continous duty or 250/330 watt continous duty stations. I set these stations and mobiles to rated power output, not a watt or milliamp/amp more of plate or collector current. Why? Because that is what the customer paid for! Customers do not pay for a 110 watt radio to have ten or twenty percent of the power lost when some technician thinks he knows better than the engineers who designed and built the equipment in the first place.

Go with the Z1A. Much more versatile and lots of easy mods. I've been
using mine mobile and it's fantastic. Quite sturdy radio; not flimsy.
Remote mic attachement nicely built. Good all-round performance.

My opinion.

The kid (Shawn/Moe) has been pumping out tons of this stuff. (I counted 32 in the dozen or so electronics groups I read, in the last 6 days). Usually by spamming the same message to a bunch of newsgroups. They're all simple naive stuff, better answered by looking in a couple of magazines or books, or in this case a quick trip to the Yahoo web site.

I just got a Heil Pro-Micro with an HC-4 element. I want to use it with an Icom IC-730.

As other posters have indicated, Heil mics really don't have enough output to properly drive Icom rigs. "Squeak" Porray, AD7K, of AES indicates that Heil may have a preamp product in the works for us Icom owners, but I'm not holding my breath.

Several hams have home-brewed preamps for the Heil/Icom combination. Does anyone have a schematic and/or experiences to share?

Thanks and 73,

James,

I don't see a conflict of interest here. Many lawyers represent competing companies. In fact, you generally seek a lawyer with experience in your industry.

The lawyer can never divulge information about one client to another, so he can't recommend actions to either about the other unless one client asks him to talk to the other. There is no conflict of interest unless one of his clients decides to take legal action against another and asks his advice. At that point, most lawyers tell both of their clients to hire another lawyer to handle that legal action.

Conflict of interest means that he is breaching confidentiality or using knowledge of one client to benefit the other. Just the suspicion of this can cause his clients to leave. Proof gets him disbarred. No wonder he is pissed off.

73,

John

1603. Yaesu FT-10 better for 2m than FT-50???

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-27 00:00:00 UTC
From: KB2UFS@gnn.com
Message-ID: <4tc95s$bbg@news-e2d.gnn.com>
Source record: 196955

I am wondering whether there is any difference in the *2m* Tx and Rx characteristics of these two radios. From the published specs, the FT-10 uses "direct FM" and the FT-50 "variable reactance modulation" for transmission. Which provides the better signal? Is there a noticable difference? Also, being less of a wideband receiver, does the FT-10 have greater intermod rejection in 2m band?

In article <4t81ab$hf@lex.zippo.com> N3XVP writes:
>I just got my call sign today. Your opinions please. Which will
>give better performance - a 6M transceiver or a 6M transverter?

That depends on the transverter, and the HF transceiver behind it.
A very strong transverter with a very good HF transceiver behind
it will beat the 6m only multimodes currently on the market. But
a mediocre transverter or mediocre HF rig will give the edge to
the 6m only transceiver.

The big thing that a strong transverter and high grade HF radio
buys you is excellent receiving performance thanks to the high
intercept and excellent filter choices in the HF rig. Most of the
6m only transceivers don't have as good an intercept or as many
filter choices. If you already have a high grade HF transceiver,
then a good transverter is definitely the cost effective choice,
and probably the performance choice as well. If your HF transceiver
isn't the best, or you'll have to buy one, then a 6m only rig might
be better, or you could just buy one of the HF rigs that includes 6m.

>I am looking into purchasing a nice, accurate watt meter. I am
>considering the Bird 43 (with several slugs) or the Telewave 44A. The
>44A has the advantage of not needing slugs, but still works over 5 to 500
>watts and 20 to 1000MHz. The Bird may be more accurate using it's
>thermal method (I don't know if the 44a uses thermal or not).

The Bird 43 is not a thermal power meter (a bolometer). It uses
a pickup line and diode. The advantage of the Bird is that each
slug's pickup line is optimized for the frequency range and power
level it is intended to measure. This can yield better performance
than a "one size fits all" approach. However, either unit should
be sufficiently accurate for amateur work.

The Bird is probably much more rugged for field use, and is very
likely to hold its value better than most other meters. There are
many beat up old Birds out there still working fine, and still
worth at least what they cost new. Isn't inflation wonderful?

1608. Icom service lament

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-27 00:00:00 UTC
From: iamweare@cruzio.com
Message-ID: <Dv6J4J.5JE@cruzio.com>
Source record: 197105

To all interested Icom equipment owners: a caveat regarding Icom "service."

Service and support:
Maybe it's just me, but when a company has a "Service Department" I expect SERVICE - not incompetence! I sent the rig in FOUR TIMES for the same problem -- a problem that ultimately turned out to be a design defect. [This defect affects the UHF volume/squelch/monitor control due to a defective connector mounting design -- e-mail me if any 2340H owners out there want more info and who at ICOM to contact).

The latest go-round occurred last week. At the invitation of the Irvine facility Sales Manager, Jim Newcomb, I sent the rig directly to him for handling since it was out of warranty. I packed it in a specially made shock-absorbing package I constructed for shipping it the FIRST time around. I also included the mic (at the suggestion of the tech the previous round -- BIG MISTAKE!!!). I got prompt action on the repair. The tech that fixed it had developed a repair technique just for the type of problem my rig had (unfortunately the techs that previously worked on it were ignorant of the technique -- something that, to ICOM's credit, it is rectifying).

I got the rig back Wednesday this week -- less mic and less my original packaging (the person to whom I shipped the radio tossed the packaging apparently w/o reading my instructions. It is noteworthy that I sent explicit instructions with the radio about returning the packaging. I immediately called ICOM about the missing mic; turned out they LOST IT! But, they promised to send me a new one UPS Red (next morning air). It was due today, but didn't arrive. It was shipped out of the Washington facility UPS GROUND!! The saga continues...

Moral:
1. Include a packing list.
2. Avoid including accessories unless required and only then attach large, plainly marked ownership labels.
3. Don't believe anything they tell you -- follow up, follow up, follow up!

In Tokyo, in Akihabara electronics district, price was 1250 yen a few
months ago, same in dollars at the time. Also, beware purchasing
electronics in Hong Kong or
Asia, as the manuals are often in foreign language, no US warranty.
From
my experiences, most things are cheaper in the US due to our dollar
being almost worthless overseas. You also have to add 10% duty to
the overseas price, and the customs inspectors know EXACTLY what
a IC-706 costs.

>

Check your Yeasu user's guide. Look for specification section. You will
find some info
on the consumption rate. See what's the ratio you are transmitting,
recieving, and stand by.
you can find out the QSO time.

Capacity (mAh) / Discharge Rate (mAh) = QSO Time (Hours)

Tell you the truth, it should run more then five minutes. I
suggest you fully discharge the battery, and than recharge.

I got Drake SPR-4 communications receiver in a lot of surplus property today. It looks to be in near mint condition, however, the power cord is missing. Looks like it will run on 117VAC, but I'm kinda unsure how to attach it. The radio has a 5 pin power connector jack on the rear. Can anyone tell me how to hook up power to this beast? I'd like to try it out!

Thanks
Russ Crisp

Hi,

I have the following items up for Best Offer:

1: Two sockets for the 4CX250's or 4CX150's
These were removed from a FM broacast Transmitter
which were manufactured by Gates/Harris. This
Xmitter was removed from service about six months
ago.

2: Two 4CX150's which were used in the above. The
Xmitter was ran at 200 watts and the tubes were
replaced every 3 months.

If interested, sent e-mail to KJ4UO@AOL.COM

Thanks!

Your question is too vague, Grady. What do you want out of a radio?
Is foot mobile operation important to you, or will you operate mostly
mobile or from the house? If the former, then you have no choice but
to look at HTs. If the latter, however, you've got a number of better
choices among mobile and fixed radios. None of the current radios are
truly awful (though a few come close), so you won't be burned too badly
by just buying the first thing you see.

That's not much fun, though. Part of the fun of amateur radio is
lingering over catalogs and spec sheets trying to find that *ideal*
radio, and talking about it for hours and hours with your buddies.
There isn't any such thing in absolute terms, but some radios will
fit your operating style better than others. And some radios will
have better IMD performance than others. This is a *very* important
factor in choosing VHF+ radios. If they howl and whine from every
paging transmitter within 30 miles, they won't be very pleasant
to use.

I only have one simple rule. It is ABK (Anyone But Kenwood). That's
because Kenwood has a continuing reputation for poor thermal design,
IE their VHF+ equipment runs too hot, ideosyncratic user interfaces,
mediocre to poor IMD performance, and even poorer factory support for
parts and service information. (Their HF gear is much better than
their VHF+ gear, it is almost like it comes from a different company.)

>be appreciated
>Thanks

All AM broadcast radios have problems in those conditions,
but there is one which stands out as better. That's the
GE Superradio II. It is the number one choice of prisoners,
and you don't get much more shielded than that. It sports
something not usually found on table top and portable AM
radios, a gang tuned RF stage. This gives it more selectivity
and sensitivity than other radios.

But if you can, an outside antenna is the better solution
in shielded buildings. Computer noise requires a well
shielded radio that only picks up signals from the external
antenna (far from the computers), and not through the case
or on the power line. That generally implies a big bucks
radio (or a salvaged auto radio fed by an external antenna).
I do the latter in my all metal shop building.

Gary

That's right, back then anyone, with their identity masked, could
intrude on my privacy. Today we don't have to put up with that.
I don't open my door to masked strangers, and I don't answer the
phone when the caller has donned a mask either.

1642. Q? about IC-706 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-28 00:00:00 UTC
From: jay@pluto.njcc.com
Message-ID: <4tg9kf$ugv@earth.njcc.com>
Source record: 196889

Well I've had NO radios for a year and a half now due to lack of funds. =) I figure it's about time to get a new radio or two. I've had a couple Yaesus and a couple friends have Icom and Kenwood stuff. Anyway, I really want an IC-706, I'm about to get my Tech+ and hopefully my General real soon. I want a radio for the car that does it all and this radio looks like it. I have two questions about it. 1) what mods are around for it? I love to tinker with my radios. And 2) what do you all think about it? I know when Kenwood's first mini HF rig came out it blew the finals alot because of the small size(too much heat). So if any of you have any bad experiences with it, lemme know. Also anyone have any opinions on the Yaesu FT-50R? I used to have an FT-470 and I liked it alot. Thanks in advance, and BTW can you please reply E-Mail, I don't have alot of free time on my hands right now, it's hard to come read news alot.

-Jay

Gee, take a valium.

How about that I have taught amateur classes, been a RACES officer for a City of nearly 200,000 for over 10 years, started many similar programs in neighboring cities when they had NO program at all, promoted ATV, Packet as far back as '83, worked closely with the administartion of a local High School for over 2 years and ressurrecting their Ham station and have been an ARES EC for over 5 years, annnnnd used my radio amateur experience to bring communications expertise to serve remote African villages in support of Famine relief as a VOLUNTEER since 1989.

I guess you've had a call sign a long time too, sonny...

BTW, the little ;-) at the end of my message was to indicate wry humor. I guess you're new at the internet too... ;-)

I've always found that it doesn't hurt to *tape* the instructions on whatever is being sent back. Tape 'em on in such a way that they don't have to remove the instructions to service the item. List your name and address, phone number, inventory, RMA#, etc.

>My only experience has been with the Drake C Line gear.
>
>I would like to know what else to consider in the same price range,
>Kenwood, Yaesu, etc. I probably can't afford Collins.

With equipment this old, condition is an overriding concern.
However, assuming it's in good condition, the Drake C line
is definitely still the best buy. The Kenwood T599-R599 is
an alternative, but I'd go with the Drake if I could, partially
because Drake still offers some support for their old C line
products while Kenwood doesn't support theirs. That can be
important if you need some now obsolete mechanical or electrical
part.

Heath also offered receiver transmitter pairs, and if built
well, they might be worth a look. I'd be careful here, however,
since construction quality would depend on the individual kit
builder.

If you aren't wedded to a *matched* pair, then you could consider
other manufacturers' receivers and transmitters. For example,
you could pair a HT-37 with a NC-190 if you chose (I wouldn't).
Or you could pair a modern receiver like the Drake R8 with an
older transmitter like the B&W 6100 (I've got one of these).
That would give you the nostalgia of glowing tubes coupled
with the much better performance of a modern receiver.

I hope you know that transceivers now rule. There are some
very good radios among them which would likely out-perform
the older separate radios. The best buy in used modern
transceivers IMHO is the IC-735. This is an incredible radio,
Icom made tons of them (the longest production run of any
amateur radio), and they're still competitive with the newest
radios. (I have one of these too, it replaced a C line.)

From: mc@shore.net
Message-ID: <4th938$ht3@northshore.shore.net>
Source record: 196915

I have a Collins 637K-1 HF Manpack antenna set (Mil number is AS-2259/GR). This was used primarily with the PRC-47 and was made to be easily carried and set up in the field. It covers 3-30MHz and were sold by Fair Radio Sales in their 1994 catalog.

The manual lists a couple of variants on the 637K-series, such as:

637K-2 which is the addition of "a 200 Watt-PEP, manually tuned antenna coupler with an RF sensor and tuning meter". This was used with other HF radios not having sufficient tuning range for coupling to the antenna such as the KWM-2.

637K-4 which is the addition of a 30 Watt PEP, manually tuned antenna coupler with an FR sensor and tuning meter for use with radios such as the AN/PRC-74, AN/PRC-64 and the AN/GRC-109.

I am interested in knowing more about these two antenna couplers such as model numbers and hopefully find someone who has either ot both of these available for sale or trade. With all the expertise here I am hoping to find out more about these two couplers.

Can anyone help?

I have recently acquired several pieces of military radio equipment and was curious as to what the prices of such items might be and as to whether or not there is a decent market. All pieces listed below are in full working order as many are "new" and have just recently been opened from their original air-sealed packaging. All accessories and spares are listed with their corresponding items. At the end of each listing I have put the date the military released them in parentheses. I would greatly appreciate it if someone could give me feedback as to how much I could fetch for each item. Thank you.

1. US Signal Corps Motorola Transmitter/Receiver Model #FSTR-140 BR (MW) 2-A 25-50 mc 60W. RF output. W/manual, box of "new" spare parts (tubes, etc.). This model was just recently opened as I had to install the tubes, transformer, and attach all wires. It runs on 20 Amps and stands approx. 6 feet tall. (1950)

2. Motorola Remote Control Console Model #PA-8270-M for use with model listed above. (1950)

3. US Army Signal Corps Jeep Raio Receiver/Transmitter Model #BC-654 Serial #7405 (1952)

4. US Signal Corps Frequency Meter Model #BC-221-AH 125 to 25,000 KC (w/transformer) (1952)

5. US Navy Aircraft Transmitter (Dynamotor) Model #T-19/ARC-5 (Mar. 1950)

6. US Navy Aircraft Receiver (Dynamotor) Model #R-26/ARC-5 (Mar. 1950)

7. US Army Frequency Meter Model #BC-221-N W/spare parts (tubes, crystals) Also includes original headphones, extra earplugs, original carrying strap, etc. (1954)

Thank you if you are able to give me feedback. Also if anyone can give me additional history on these items I would appreciate that also.

Source record: 196961

Well, Gary is NOT the FCC...here is their reply to the question....
If you have any problems with it, try to get the rule changed! But breaking it doesnt
make it right or legal:

Subject: Reverse Autopatch on Amateur Radio repeater systems -Reply
Date: Thu, 18 Jul 1996 08:39:44 -0400
From: Bill Cross <BCROSS@fcc.gov>
To: cboone@earthlink.net, fccinfo@fcc.gov

The ruling has not changed. Those trying to argue that a part of the call (the ring etc.) is "telemetry" are trying to find a way around a rule they don't like. This e-mail is your writtem confirmation.

William Cross
Private Wireless Division
FCC

So what about the door alarm, or the power failure alarm- ?
Are these also a violations? a I state again, a third party could be the cause of a radio transmitting, in either one of these cases.

Remember- ring voltage on a twisted pair is only there to tell the user he is being summoned.
Who gives a care? Its a lame rule, when you can turn around and
order a pizza on the damn thing anyway.

73- Dean LaClair

Ps - On the subject of what HR is comung to, have you listened on 75 meters lately?
reverse patches are peanuts.

1674. Re: IC-27A How can I generate PL tones on Simplex?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-28 00:00:00 UTC
From: bd703@scn.org
Message-ID: <Dv88xo.601@scn.org>
Source record: 196962

In a previous article, jkolin@cloud9.net (Jay Kolin) says:

>My IC-27A manual says PL tones are only generated on
>duplex and not simplex.
>
>Anybody know how to make it generate these tones on SIMPLEX?
>
>
>Also, I see a "Mute" diode on the schematic. What does it mute?
>
>Jay NE2Q
>

I don't know about the mute diode but the "trick" for generating a PL tone
on simplex is to set the offset to 0.00 khz; then put the radio into either
+ or - duplex. (Of course select the correct tone first).

The radio will think it is in duplex mode and generate the tone, and since
the offset is 0 the tx freq will be the same as the rx freq.

1675. Radio Depot in Bremerton, WA burglarized.

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-28 00:00:00 UTC
From: bd703@scn.org
Message-ID: <Dv89Ar.66x@scn.org>
Source record: 196963

The Kitsap Co sheriff Dective Division is the
investigating authority at 360-876-7101

As you have heard by now Radio Dave was burglarized Saturday nite The thieves
gained entry by forcing the front door. His insurance status is uncertain at
this time. This event could put him out of business.

Here is a list of the stolen equipment from Radio Depot, Bremerton.

Please distribute it to your friends, local radio stores, and publish it in
your club newsletters, etc.
We plan on giving this national distribution but need your help in doing so.

As you can tell the loss is substantial.

Thanks, Dick

So exactly *where* should amateur radio equipment be sold? The market still
isn't large enough to support specialized amateur radio stores in most cities,
so -- unless you happen to be in the same town as one of the big ham dealers, or
in a very large city -- the choices boil down to (1) mail order, (2) wait for
the next hamfest, (3) drive a long distance to a dealer or a hamfest, or (4)
Radio Shack. And they caught the same grief that Kenwood is now taking.

1685. Re: Kenwood To Sell Radios in Truck Stops and CB Shops

I used to work for Tandy and I can understand the liability issues that would keep them from selling to non-hams. The typical customer at Radio Shack has an IQ only slight above the average carrot. Actually, I saw a fax once that might explain why they stopped selling to just anyone. If what I saw was credible, some moron bought one of the 10 M SSB rigs and hooked it up to his CB antenna, and although he could hear us hams, he couldn't get anyone to answer him. So he got the bright idea to go back to RS and buy some connectors to hook to a better antenna. Unfortunately, his idea of a better antenna was his cable system. The fax was of a letter from this individual asking that RS reimburse him the $24K that the cable company was asking from him for damages done to their system.

>Cut diode D12.

Nope, not this one. It's for reverse battery protection.

The HTX will not allow an out-of-band frequency to be stored in memory permanently. Yes, you can store said freqs. temporarily, but they vanish as soon as you cycle power or select another programmed memory channel and return. The software will also hold the MUTE line active to prevent audio from reaching the speaker. (Note that the s-meter will show activity but no audio in the speaker.) You can convert the radio to non-software squelch but that won't help due to the erase condition mentioned above.

Squelch control originates from pin 14 of IC2 then goes to the micro as the BUSY signal (pin 14 of CON2). The micro then sends a MUTE signal (pin 12 of CON1) that turns on Q13 which then turns on Q14,Q15 to route the audio to ground.

The only hope is if there is a resistor or diode connected to the microprocessor that, when removed, allows the software to store (and keep) the freqs. in memory. I don't see anything on my schematic that indicates such a possibility.

I think the legal guys at Tandy misread the federal laws with respect to amateur radio equipment receiving out-of-band frequencies. They changed their minds as you will see in the newer 2-meter radio from the Shack.

>see it jump to 50 watts (using a digital wattmeter).

Turning down the input to a *linear* system had better reliably
turn down its output, and a SSB transmitter is supposed to be a
linear system. Otherwise the system isn't linear, IE it is *broken*,
and needs to be repaired. *Of course* it is sensitive to input audio
amplitude. That's what it is *supposed* to do, faithfully track
amplitude variations of the input signal on its output. If you have
an instrumentation problem, solve *that* problem, don't corrupt the
signal to be measured to compensate for the inadequacies of the
instrumentation.

>Turning on the speech processor helps. It levels out the audio
>a bit. But it does not keep the power output level from the rig.
>It is just too hard to stabilize it without ALC control.

Both speech processing and ALC are forms of *distortion*, driving
their stages away from linearity. Some people seem to like distortion,
I hear it on CB, and 75m, all the time, but it usually isn't a desirable
trait. ALC should only be used as a last resort, a bandaid, to mask an
underlying problem with the linearity of the circuitry being driven. Like
putting a bandaid over a skin cancer, it doesn't make the problem go away,
it merely hides it from your sight.

External power amplifiers often include provision for ALC to prevent them from being overdriven, but the real problem is that they lack sufficient headroom, or that the exciter is setup for excessive drive. If you consistently see an ALC indication, reduce microphone gain, you're hitting the amp too hard. Rather than bandaiding the problem, it should be fixed at the source. In this case, the source is the operator who lacks the proper skill to speak across the microphone in a consistent way.

>There is a mod out there for changing the carrier control to an
>ALC control, but it allows a very high power output at the extreme,
>more than I would want to subject my 440 output circuits to.
>
>The simplest and most reliable method is the 9 volt battery,
>10 k pot (I believe that will do it fine) and put the negative
>into the ALC jack in the back. Adjust the voltage till you get
>the desired power via ALC. This actually works.

And actually adds even more distortion since reducing the gain of the PA almost always increases the intermodulation products it produces. Linearity is almost always best at the design gain of the amplifier (unless it was grossly misdesigned). If you want 13 db less output, supply 13 db less input (at the microphone connector). Lots of amateur signals would sound better if they had a 13 db pad in the mic line.

I've tried all the external stuff before posting. I don't want to void
the warranty so I more or less was asking if anyone had this problem
before and what the fix is.
My idea is that the RX is still there just the connector (inside) is
off or the ant switch is bad or as some one else suggested some diodes
in the front end may have gone bad.

Thanks
Ben

Don't take an unsealed lead-acid battery on an aircraft! It could be the last
flight that you or other occupants of the plane ever take. Potential problems:
1) Spillage of highly corrosive sulphuric acid, damaging the aircraft;
2) In case of an accident which ruptured the battery case, the acid could be
splattered around the cabin;
3) Lead-acid batteries vent flammable hydrogen gas. Yes, I know that this is
normally only when they are re-charging, but some hydrogen could be retained

inside the case, and vent while in flight, especially considering low cabin pressurization levels.

I know that there are strict rules regarding shipping lead-acid batteries on aircraft (I work in the transportation industry.) I don't know for certain, but I strongly suspect that similar rules are published for transportation of carry-on items. Contact the local FAA or NTSB office for details.

I also suspect that while somewhat safer, gel-cells are likely subject to the same regulations and warnings.

Remember that until evidence proves otherwise, the liklihood that TWA 800 was brought down by an unsafe shipment is just as high as a that of a bomb or missile.

1706. TH79 9K6 mods

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-29 00:00:00 UTC
From: ea4abb@linux.ea4abb.ampr.ORG
Message-ID: <Pine.LNX.3.91.960729102508.419B-100000@linux.ea4abb.ampr.org>
Source record: 197028

Hello ! Here I send you the TH79 mods to connect to a packet 9600 bps modem=
.
The problem for me is that the text is in another language.

I hope someone can translate it to English or Spanish=20

----ZZZZZZ>>>>

**=20
* 9600 Baud FSK-Modifikation f=81r das Kenwood TH-79e *
**=20

Tach zusammen !

Hier kommt ne Anleitung zum Umbau des TH-79e auf 9k6.

1. Oeffnen des Ger=84tes:

Alle Stecker incl. Antennenkabel abziehen, den Akku entfernen.
Auf der Rueckseite des Geraetes die 3 Schrauben loesen, ebenso wie=20
die kleine Schraube an der Seite beim Antennenanschluss. Vorsichtig=20
das Gehaeuse oeffnen. Nun die Haelfte mit der LCD-Anzeige nach links=20
legen, und die andere nach rechts (wer haette das gedacht :-)
Falls ein CTCSS-Modul drinne ist, kommt das auch raus :-)

2. RX-Modifikation:

Die vier Schrauben in der (ich nenn sie mal) "Power"-Haelfte (mit
den beiden HF-Hybrids und dem vielen Kupferblech) rausschrauben und
vorsichtig rausnehmen. Dazu muss noch die BNC-Buchse weggeloetet werden.
Auf der Unterseite gibts nen IC Marke Motorola MC3372D (Demodulator),
der ist fuer UHF. Das RX-Kabel wird da am Pin 9 angeloetet.
Damit ist der RX-Ausgang vom UHF-Empf=84nger IC schon mal fertig :-)

3. TX-Modifikation:

Im zweiten Gehaeusedeckel (mit den Potis und den MIC/Lautsprecher-Buchsen)
gibt es eine "Tochterplatine", die den Mikrophon-Amp beherbergt.
Einfach die Platine runtermachen, ein Draht an den Widerstand neben dem
IC 308 (TA75W558F) und das ist die TX-Einspeisung.

Ich hoffe, in der kleinen Zeichnung kann man was erkennen :-) =20

Der Draht wird am oberen Kontakt vom R angeloetet (wo das R steht), der=20
betreffende Widerstand ist ein groesserer Widerstand als es die andren=20
sind.=20

```
! ## + ***(IC308) !
! ## *** !
! ## !
! ## !
! ## !
+-----------------------------+
```
Steckkontakt zur=20
grossen Platine

Wenn fertig, wieder die Platine auf den Kontakt stecken.

4. Letzte Schritte:

So, die typischen 2 Draehte sind angeloetet, ist auch keine Bruecke
unerwuenscht entstanden ?! OK, dann das ganze Geraet in umgekehrter Reihen-
folge wie beim Zerlegen unter Punkt 1 wieder zusammenbauen, kurzer
Funktionstest, und dann kann das ganze schon an das FSK-Modem angeschlossen
werden.=20

Gedanken muss man sich nur noch =81ber die Verbindung zur Aussenwelt machen=
,
entweder einen kleinen Platinensteckverbinder (3-polig und einen Pol davon
abfeilen) oder eine 2,5mm Monobuchse (passt wahrscheinlich ebenso nur ab-
gefeilt rein) ins Geraet reinbauen.

Ich uebernehme keine Verantwortung f=81r die Richtigkeit der in der Anleitu=
ng
gemachten Angaben und f=81r Schaeden die im und am Geraet durch die Modifik=
ation
entstehen. Die Anleitung ist etwas groesser geworden, daf=81r aber (hoffe i=
ch)
einfacher und auch f=81r Nicht-Profis (etwas Loeterfahrung braucht man scho=
n!!)
verst=84ndlich.

: reason that we are so screwed up. The thought of having a radio that

Let me see if I've got this. We (whoever the collective is referring to) are screwed up because hi-tech, leading edge technology is cheap enough to buy new on a regular basis. Uh-huh...

: is 20 years old, are you out of your mind. Hell just buy a new one and
: keep yourself in debt.The radio gear may have been big, heavy and old.
: But it did last years and was a lot more fun. For the most part

But I thought we just established that they were cheap. It follows then that debt should NOT be a requirment.

Then along comes this reference to fun. Now I'm beginning to understand.

"Back then" you had leading edge technology, that you had to build because nobody else did, and it would have been ruinously expensive to buy even if they did. And it was "a lot more fun" because there weren't legions of bitter aging old men on the air whining about how things used to be.

I have just recently become involved in this pastime, and I've got to say that your view is all to common, and because of it, I am embarassed for you.

Hams lay claim to vast areas of the spectrum. The equipment on the market today is cheap, reliable, and offers a staggering array of performance and features. And STILL you can't seem to attract enough interest from prospective new users to fend off attacks on the spectrum you own. Witness the recent shots at 2m and 70cm by the commercial lobby. We still hear, years later, bitching about the no-code technician class, a move that breathed more life into amateur radio than anything in the last couple of decades.

Get OVER it! Find ways to solve problems or watch as people who WILL use your parts of the spectrum take them away from you.

MILITARY AFFILIATED AMATEUR RADIO SERVICE

The mars mod allow ur radio to transmit out of the amateur bands. For example Army Mars uses frequencies arounf 4.035 Mhz. Normal amateur gear does not allow you transmit in this range. The Mars mod opens up the transmitter

73,

steve

D6 on the filter board has been known to blow. It appears a 5/8 wave 2 meter antenna works great on 6 meters also. When you have the 2 meter antenna attached, and transmit on 6 meters a very high RF power is poresented to the 2 meter port, thus blowing D6. Prevention is seperation, get the 2 meter antenna as far as possiable away from the 6 meter antenna.

1) Heath HM-2140 dual wattmeter, heavy case, two-tone green. Reads PEP with 9V battery installed. Has remote sensing unit.

2 kW max power.

Excellent shape with manual, $90.

2) Heath SA-2060A roller inductor antenna tuner. Two-tone brown, in very good shape except for scratches on top case. Reads SWR/ fwd/ref power and has a large coil, two large, high voltage, air variable caps, and a good sized balun.

Wotks perfectly, feeds 2 coaxes (tuned) plus through line (coax) and long wire/balanced line. Feed towers are ceramic.

With manual, asking $220.

1716. FT-50R Solder Pads?

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-29 00:00:00 UTC
From: Tom <tkoliver@telis.org>
Message-ID: <4tin26$5to@mentor.telis.org>
Source record: 197038

I know I have posed this question before, but...

Does anyone know what the other two solder pads under the keypad do to the FT-50R? I have removed the bridge on the first pad, giving me extended xmit.

Thanks,
Tom

FT-900 Help,

Make sure you have the ends of the YSK-900 cable hooked up correct.
Try switching the ends and give it a try.

1719. 2 way communication for snowmobile

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-29 00:00:00 UTC
From: ajp1@msg.ti.com
Message-ID: <4tiruj$t0t@tilde.csc.ti.com>
Source record: 197041

I am a snowmobiler who is interested in gettting some type of 2
way communication radios for talking to others in our group. There are a
couple of commercial radios out there. Collett makes both a 900MHz and 49MHz
version of their communicators.

Are there any other options that you all may be familiar with? I am looking
for something relatively lightweight, good battery life, VOX is a must, range
of 1/4 mile or greater.

Any suggestions would be appreciated. Please respond by e-mail as I do not
read this group on a regular basis.

Thanks for your help.

1720. FS: Alinco DJ-580

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-29 00:00:00 UTC
From: greg@snoopy.gwr.com
Message-ID: <4tid7u$4gc@tracy.nacs.net>
Source record: 197042

I'm looking to sell my Alinco DJ-580 Handheld radio. For those unfamiliar with it, it's a dual band 2m/440 handheld. It's not in production anymore -- Alinco makes the 582 now, which has a feww more bells and whistles.

I also have the stand-up charger that comes with it, the 700mAh nicad pack, 2 AA dry-cell packs, a filtered car power adapter, and the speaker-mic with remote controls.

The radio is a little over 3 years old, and has been back to alinco twice (once early on for a re-alignment, then once later on for a new antenna connector). The numbers on the kypad are worn, but the radio works just fine.

I'm getting a fancy brand new rig, so I want to get some money for the old one. Make me an offer I can't refuse.

Sounds like it has stuck the "general coverage" filter ON, even on
2m. The response numbers you quote are about right if that's the
case. Check at J4 pin 3 on the PA unit for 4.8 volts when tuning
inside 2m, and 0 volts otherwise. If you see 0 volts while inside
2m, you have a problem on the main board. Check IC32 pin 11 for the
L8 signal. If not, replace IC32.

If you have the signal at J4 pin 3 of the PA unit, then the problem
is in the PA unit. Q17, D18, Q25, and Q24 are possible culprits.
If they're good, then you've probably lost D6 or D7, the PIN diodes
which switch filters. (This is pretty likely, there are reports of
these diodes being a problem area.)

Note these are all SMD parts. If you don't feel comfortable replacing
SMD, send it to the factory. But you can do the measurements and at
least be able to guide the factory to a solution (or catch them if
they're clueless).

>Billy - kc4pe
>kc4pe@cbus.mindspring.com

60 db gain! Ouch!. That's way too much. And it is unlikely that
one would want a bulky tube mic preamp on a small solid state radio.
A simple 2 transistor preamp will do nicely for the 20 db of gain
you actually need. There's a suitable design, with feedback to linearize
it, in "Solid State Design for the Radio Amateur" which should work
fine. It'll fit inside a hand mic case, or in a small Bud box. Power
it off the 8 volts supplied at the Icom mic jack.

You could just use an IC audio preamp, but the discrete design
has lower noise and a better impedance match, which will preserve
the frequency response characteristic of the Heil element.

Ben,

Before buying my 706, I did a little research and found one source that indicated that the 706 could become deaf on 2M due to tranmissions on HF, if the antennas were closer than 4 feet to each other. I seem to remember that D6 in the VHF frontend was destroyed.

My antenna are about 4 feet apart, however, and I have not had this problem. Let me know if this could be the same problem you are having.

At the risk of sounding like a smart ass, your'e a ham, fix it. Try for the obvious first. Look to make sure the ant cable, etc are not shorted or open. Check inside the rig to see if the connection to the ant connector is ok.

Not that obvious? Ok, on to next step.

Inject a signal and try realignment. If you are hearing anything at all, if's are probably ok. Check ant preamp. Mega input, (like 6.5 to 30 uV) will jump an amp. inject a signal just after the ant preamp. If the amp is bad, the sensitivity should actually improve a little.

If it was working, and quit after the ant was removed, it is more than likely the antenna or related cables. As hams we tend to take shortcuts and miss little things like sealing connections. I would almost bet money on this. Check all of this out then go to surgury as a last resort.

Check the ICOM audio. I find that the audio PA noise and distortion
levels are not suitable when using headphones. I found this with my
new 738 and have confirmed the problem on several demo units at the
Tucker showroom.

I purchased the 738 for the internal keyer, band change buttons (with
band stacking), and antenna tuner, verses price.

Myself, I would trade the keyer and band stacking options for a Kenwood!

> Customers do not pay
> for a 110 watt radio to have ten or twenty percent of the power lost when
> some technician thinks he knows better than the engineers who designed
> and built the equipment in the first place.

The problem with that reasoning is that the technician in the field probably does know better than the engineers who designed it in the first place. He has much more real world experience with the unit's MTBF rate and common failure modes. What the customer is *really* paying for is a reliable radio that works when he needs it. He won't realistically notice a -0.4 db signal strength reduction, but he *will* notice when his radio has to go into the shop 3 or 4 times as often because of thermal stress.

For the same reason a *smart* building maintenence technician will use 130 volt bulbs in 120 volt circuits, the *smart* (or at least ethical) technician will derate equipment to extend its life. The customer appreciates that much more than the 0.4 db power difference he can't notice anyway.

BTW, have you ever wondered why a radio is rated at 110 watts instead of 100 watts? It is because the *marketing* department wanted to one up the competition. Marketing still wants the price to be competitive though, so engineering has to cut corners and push the equipment to the limit to meet marketing's demand. To hell with MTBF. If that's too high, there won't be any replacement sales.

There are but few vices I subscribe to. I don't chase women. I don't drink. I don't smoke. My language isn't too bad. If I can't bore a 3/4" hole in the top of the new car, I suspect my next purchase would be a bottle of Ron Rico and a pack of cigars. I would then settle in figuring what type of women would let me bore that hole.

Hello.

To those who own the TS870...Was it worth the $? I've played around with one and it seems that it nearly eliminates "listener fatique", as the static is nearly gone, etc.

Explain your feelings on the rig; it would be appreciated!

Marc

Guess the moral of the story is to not mod the rig for wideband tx, or not
transmit outta band, right guys ???

All you have to do to adjust cw sidetone is to adjust the "MONI" knob
to the desired level you want.... the moni knob is located above the
AF/RF knob on the front panel..
good luck and enjoy..

> a while of my resumed QSO I found the everything was working
> fine again?

Before you return the radio, check these two settings, either
could have caused the transmitter 1/ to stop transmitting
and 2/ not to transmit when ptt keyed.

1/ TOT(22)- transmit time-out timer
2/ BCLO(23)- busy channel lock out

If either were selected to anything other than OFF, it may have
been the cause of your trouble.
hope this helps

A gel cell and a lead acid cell are basically the same chemistry.
the Gel cell contains gel instead of liquid, and usually costs more
per amp-hour. Of course, since battery acid is destructive and
potentially dangerous, portable equipment usually uses gel cells.
Ni-cad cells have some advantages, but usually cost more per
amp-hour than gel-cells. Nicads often have lower internal
resistance, and are easier to charge correctly (constant current vs
constant voltage.) Ni-cads self-discharge rapidly, so gel
cells are good for batteries that are often left on the shelf
for months. Nicads are probably a bit lighter than gel cells.

If you are looking for 6-amp hours, I think that gel cells will
be much cheaper, and probably the best way to go. For lower
amp-hours, I would probably choose ni-cads, as the cost difference
would not be as significant.

Where can i find a mobile antenna base that will easily swing down 90 degrees to lie flat along the roof?

I want to mount it outside the drivers window, on the gutter or roof, and be able to reach out the window to lay the antenna flat as necessary.

I am sure i have seen something like this. It was some kind of ball-joint with detents at 90 deg. to hold the antenna in place.

It should be able to hold a standard 5/8 wave 2-m antenna.

I need to get this soon for an upcoming road trip. Thanks much for any help in finding this antenna.

From: Drew Loker <Loker@tenet.edu>
Message-ID: <31FE07FA.2242@tenet.edu>
Source record: 196777

I am able toet the limits, but I am not able to scan just the limits.
The instructions indicate that a PMS 1 or PMS 2 should be in the
display, but there is not. When I try to scan, it either scans the
memory, or if I hti the MR button to go to memory tune (which is when
the PMS is supposed to show up, it just passes the limit right up.

Any ideas?

Thanks!

To prevent scratches on displays of radios, COVER it up with Clear shipping tape. Then you just replace the tape when it's scratched up.

Just me 2 cents!
Bill - KC7KST

PS: I've done this on every radio I've owned and have never had to see a ding on the display window. Helps when selling the rig also!

This approach was tried with CB. Originally you had to have a simple licence for CB. Gear was too easy to buy and the CB band and later the frequencies from the top of the CB band to 10 meters was destroyed by illegal operators. The residue (ham rigs on 11 meters, VFOs and amplifiers) is still with us today. Unfortunatley it will not take very long for this to happen to all the popular ham bands which have been created by almost 80 years of dedicated effort. The Kenwood approach will actually destroy the ham bands not save them.

That said we can do a lot to pass on ham radio to the next generation. Join your local radio club, offer to teach a class and make a difference! In 1995 our club helped over 80 people get their licence, we were astonished at the level of interest.We are now holding upgrade classes.

I would ask Kenwood to put their money into widely advertising ham radio and perhaps subsidizing the high cost of training videos and texts. They could also assist in the battle to rescind restrictive antenna CC&Rs and zoning rules. It is frustrating for new hams (novice and tech. plus) to find in many cases that they cannot putup a HF antenna.

Hi MCB 07,

I am not certain what the difference is between the FT-10 and the FT-10R, but here is what I found on the FT-10. Hope it helps.

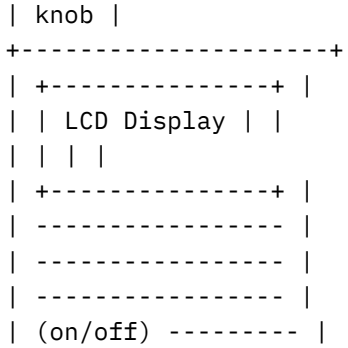
Glenn Reed, KF5XB
CAP - OKWG/DCA

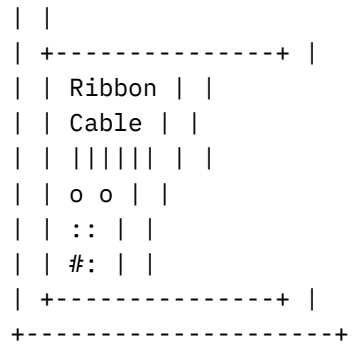
==========

From: jospav@eworld.com (Jospav): rec.radio.swap: mod for FT-10, here it is: 23 Feb 1996 19:54:01 -0800: eWorld: <4gm24p$7mp@hp5.online.apple.com>: jospav@eworld.com (Jospav)

FT-10 Extended Transmit Mod for 140-174MHz use.

1. Remove antenna and battery.
2. Locate the Ni-Cd battery sticker on the back of the radio chassis. Pry up the corner of the sticker and peel it off carefully.
3. Remove the two screws located under the sticker. These retain the keypad.
4. Slowly lift off the keypad. Use care not to dislodge the gasket.
5. Locate and unsolder the 0 ohm chip resistor at location "M" (see diagram below).
6. Re-install keypad with two screws. Be sure gasket is properly seated.
7. Replace the Ni-Cd sticker if desired. Reattach battery and antenna.
8. Press down and hold the Top-Notch and Lamp button while turning the radio on.





= Location "M", chip resistor to remove

If memory serves me, the board actually has an "M" near the correct

Don't you mean "typical employee at RS"?

Your report of the cable company's request for $24,000 in damages is
interesting. Since the HTX-100 (10 meter SSB rig) has some fairly
aggressive SWR fold-back protection* -- the reason the CBer couldn't
transmit on a CB antenna -- it surprises me that the HTX-100 could
feed enough signal into as mismatched a load as a CATV cable, to do
that much damage.

* I know, I used to own one, and it DIED at a 2:1 SWR, falling to
less than 5 watts on hi-power and less than 1 watt on low. A nice,
almost indestructible rig with SUPER ears.

Maybe you should report the fax on alt.folklore.urban -- I mean, if
you could blow out $24,000 of cable TV hardware with a $100 CB radio,
don't you think somebody else would have done it? Don't you think
it would be a major tool of urban mischief? And finally, if
the line amps were that susceptible to CB damage, don't you think
there would be high-pass filters and 27 MHz traps in the lines and amps?

A post is a boating newsgroup raised my curiosity about this...

Does anyone know if Motorola makes a hand-held VHF marine tranceiver?

The last time I asked our account rep from Motorola about this he said that they didn't. In addition it does not appear that they make a programable radio (from their LMR line) that is type accepted for marine.

Ignore that garbage about D12, he's being a jerk.
Diode D12 is a power supply protection diode. It protects the radio
from the wrong voltage polarity.

1779. Quick Call Codes

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-30 00:00:00 UTC
From: cn1135@abaco.coastalnet.com
Message-ID: <4tk1c2$nth@treasure.coastalnet.com>
Source record: 196987

Greetings,

I am trying to convert Quick Call codes for Motorola Dispatcher to tone frequencies. I am able to convert the codes for mobiles and portables such as Code 125 is 746.8hz. But the codes for the dispatcher are different. After a recent power outage, the codes were input into the console as three digit codes(ex 218) with a one(1) placed in front of each code. Code 234 was entered as 1234.

I know that the station with Tone A as 746.8hz and Tone B as 669.9hz is given as code 253. My untested hypothesis is that 253(input at 1253) is a combination of the codes for tone A and B. I think that this may be so because Tone A has the QC code 125 and Tone B has 123--Hence the code (1)235.

Please post any information back to the newsgroup or email me direct.

Thanks,

Mark Prescott

Kevin, in the old world, by law we get one years Garruntee for
equipment. Trying to fix something invalidates that. Therefore, if it is
less than a year old, it has to go back, even if you know whats wrong,
just in case something major happens later. So first we need to know
if Bens 706 is still covered.

The loss in sensitivity sounds like a blown front end device, but it
could be so many things. Alignment is one of the more improbable.

1782. Battery / DC power info

Source record: 196990

Hi,

Looking for "suggested reading" material before embarking on
a backup power project for a portable HF ham station. Need
to get some basics down, including battery selection, battery
care, battery charging etc. I have read lots of hearsay and
want some definitive sources of information. Prefer gel-cells
due to safety concerns / inability to store non-sealed batteries.

Can anyone with first-hand experience suggest the following:

1. If one had 2 batteries, would you use one till it ran out
and then switched to the other battery, or, run both in
parallel? I assume parallel would be best ...but....

2. Do gel-cells require constant voltage or constant current
to properly recharge? I believe NiCads prefer constant
current.

Again, looking for online or library reading material to self-educate.
Periodicals are tough to get ahold of, but would consider those too.

thanks,
Joe

Ben as long as Icom have used a proper connector, like an N-type or a BNC it is not going to be that. If they used an SO239, send the rig back and ask for a refund or a proper connector.

You may have some metal swarf in an N-type causing a short circuit, I have had this happen to me.

I would send it back to ICOM. They give very good service in the UK and I expect it is the same in the US.

It's not a pastime. It's a service. Read the FCC stuff in your study guide.
Don't feel embarassed for us, we were doing fine before you got here.
We'll be doing fine after you're gone, if you decide to leave.

>Hams lay claim to vast areas of the spectrum. The equipment on the market
>today is cheap, reliable, and offers a staggering array of performance and

Cheap, huh ? Let's look in the catalog. Last time I bought a top of the line
Icom HF transceiver, it was about $1400. Now I can get a 781 for only $6600
or the not top of the line 775 for only $3900. Not exactly cheap, but - OH,
thats right, you said you were a NEW guy. When you say ham 'equipment', you're
probably referring to a Radio Shack HT, right ?

>features. And STILL you can't seem to attract enough interest from
>prospective new users to fend off attacks on the spectrum you own. Witness
>the recent shots at 2m and 70cm by the commercial lobby. We still hear,
>years later, bitching about the no-code technician class, a move that
>breathed more life into amateur radio than anything in the last couple of
>decades.

We did 'witness the recent shots' at 2m and 70cm. They were a figment of
somebodys imagination. Still are. Even the FCC said so. From my prospective, I
can't see how the no-code tech license 'breathed more life into amateur radio'.
I imagine it filled up a lot of 2 meter repeaters with people who use to be on
11 meters. I went to the local 'ham' club meeting this month, which is
something I haven't bothered to do in about five years. Same discussion as five
years ago - the repeater. I didn't want to be impolite by just leaving, it's
not a very large group anyway, so I tried to add to the discussion by bringing
up the fact that vanity gates are open that would allow us to obtain the call of
a silent key who was a very well known ham here and use it on the repeater.
I wasn't really too surprised when one of the guys who uses the repeater ask the
question 'Well, what IS the callsign of the repeater anyway ?'.

'We' aren't in the recruiting business. The ARRL is. They need to sell magazine
subscriptions. W5YI is, he needs to sell code tapes. Gorden West is, he needs
to sell his 'dipoles for dummies'. Somewhere along the line you got the
mistaken impression that hams are supposed to be standing on street corners
looking for new recruits. That's not hams - that's the Salvation Army that
does that, John. I think if your career in ham radio advances, you will find

that most hams are very willing to help new people get started in the hobby if new people approach them and ask for help. But very few hams are running around trying to 'attract any interest' from non hams.

>Get OVER it! Find ways to solve problems or watch as people who WILL use
>your parts of the spectrum take them away from you.

It all depends on what you mean as 'your part' of the spectrum. What I consider the 'ham bands' (HF) has gotten bigger in the last ten years, not smaller. We were given three new bands. If someone takes away two meters, as you and a few other people imagine they are trying to do, a lot of new 'hams' will be out of business, and maybe a few old ones will be too. But you have to remember that to a lot of us 'old' hams, VHF ain't ham radio. HF is. Nobody wants HF, except for Radio Moscow, The Voice of America, and a few long distance bible bangers. There's PLENTY left for us old hams.

You see, John, to some of us, using the autopatch and talking to somebody 3 miles away on the repeater is not what keeps us interested in ham radio. We're more interested in a lot of things that some 'new' guys have never heard about. Grey line low band DX, long path openings, over the pole DX, stuff like that. Anybody can run into Radio Shack and buy an HT, charge the battery, and talk on a repeater. Everybody can't figure out when and how to work another ham station half way around the world on 80 or 160 meters. Some of us won't even miss two meters if it goes away (which it probably won't).

You didn't mention your call John, you said you are new, but what bands are you on ? Are you on 2 meters ? 440 ? Six meters ? 1.2 GHZ ? HF ?

73, Jim KH2D

>and 2m?

Mine works great.

It has three flaws that greatly affect its CW performance:

1.) The keyer has no weight control
2.) The QSK does not work correctly, it decreases dot and dash length
3.) The CW filter has blow-by

Even with those flaws it's a very nice mobile rig for casual operation,
well worth the money.

Ok, *I'm* confused. How are you using an "antenna splitter" as a
switch? Do you really mean you've installed a coaxial switch?
And exactly where in the circuit is it? Your language is imprecise.
Do you mean it's hooked up like this?

```
/o-------dummy load
XMTR---METER-----o/
o-------Antenna
```

If so, then what are the SWR readings with the switch in the two
positions? Sounds to me like the switch is introducing a serious
mismatch into the system. The *apparent* power reading of the meter
will be affected by the SWR on the line in which it is installed.
Depending on the mismatch value, and the line length, the forward
power reading could be less than, or greater than, the actual
transmitter output power. Only by knowing both the forward and
reverse power readings can you derive any useful information.

: the window. Now what....Would a soft case help prevent this?

Putting clear mylar (one side sticky) or something like that seems
to work good. Use it on bloth my HTs. Also, for BNC antenna radios,
a BNC male to female adapter helps life on the radio's connector if
antennas are changed a lot. They are usually made cheaply on the radios
I have seen. Good thing the FT-50R uses an SMA instead.

The cable that came with the ADMS-1c software was a two part cable. The main part was for the FT-51,11,41 series, you than added the FT-50 part which was good for the 50,10,40 series. So it should be good.

I purchased a TS-870S at the beginning of this year and have used it extensively on SSB, CW, FSK, and some on AM and FM (mostly SWL on AM). I was lucky enough to get to do reviews for a ham mag on the other two DSP radios on the market and when I did I wondered if I might end up being dissatisfied with my 870. Though in my opinion all three radios were very fine high end products and like all complex operating systems had some small bugs, I was not tempted to trade my 870. I would *love* to have a radio that offered my favorite features of the three and for some operators the choice would defiantly be one of the other three but for me and my operating techniques I was unable to find a radio that I like better.

Must Sell ASAP: (No reasonable offer refused):
(3) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 2 brand new batteries, 3 older batteries, a SMC antenna (standard Uniden Mount), a gain BNC antenna (has BNC-SMC converter), a mag mount mobile antenna, 3 rapid chargers (not available anymore, hard to come by!!!) and 2 vinyl holster (no belt loop, just more for shipping/travel. $200/ each, or $475 for all 3. Invested much more into it. 2 currently programmed for TAC use.

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

(1)Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, Dual watch, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) (PLEASE don't ask how to do it, I was overrun by more questions on how to do it than offers to buy..)Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $280/BO.

WTB: Icom U-16, must be in good condition. Make offer, or trade for one of the above??

WTB: Yaesu VX-10.. Make offer, trade for ALL of the above?

All prices plus shipping + COD. I am NOT a company, just a collector of stuff I no longer need. <GRIN>

ALL PRICES NEGOT.! I need to sell, so give me an offer!

eplatt@wco.com, or call me anytime at 415-939-1037.

<FITR%mimi@magic.itg.ti.com> writes
>1. If one had 2 batteries, would you use one till it ran out
> and then switched to the other battery, or, run both in
> parallel? I assume parallel would be best ...but....
>2. Do gel-cells require constant voltage or constant current
> to properly recharge? I believe NiCads prefer constant
> current.
Joe,

Here are some thoughts from my experiences with these batteries:

1. Use one battery first, then the other. *Don't* over-discharge either type, or one or more cells may become reverse charged and thus damaged. If you connect two batteries in parallel, one will probably discharge through the other until the voltages are equal, thus wasting power. This current could be quite high.

2 (a). Gel cell batteries *must* be constant-voltage charged; constant-current charging will soon destroy them. 2.3 volts per cell is typical if the batteries are floated across a power supply (This voltage may need varying with ambient temperature). The voltage should be set, accurately, with the charger off-load. Some batteries will accept slightly higher charge voltages like about 2.4vpc for a quicker charge when used in cyclic (charge-discharge) mode. Charge time must be limited to that needed for a full charge, and no more, when doing this. Check the manufacturers spec. for all charge voltages/times. Be sure to use gel batteries designed for cyclic use; if you use float-only (standby) types this way, their life will probably be rather short.

2 (b). NiCd (or NiMH) cells *must* be constant current charged at a rate/time combination permissible for the cells concerned (again, see the maker's specs). Ideally, C/10 i.e. 400mA for 4AH 'D' size, for 14 hours, etc. You _can_ charge faster, but be very careful not to overcharge, or cells may be damaged and may leak, burst or explode, releasing toxic matter. *Never* try to use a constant voltage charger for NiCD or NiMH; damage/destruction of cells and/or charger is almost certain.

I have used both of these types of batteries very successfully for many years and have had very few failures. Don't trust any charger until you have tested and approved its voltage/current output settability and stability; many are very crude and can greatly limit battery life. Be sure that the charger is protected against mains failure; some will be damaged if this happens with a battery attached. The LM317T (1.5A) and LM338K (5A) regulators make excellent gel battery chargers with a few

peripheral components. The humble 7805 can be wired as a constant current device to charge NiCd/NiMH cells. Use a good heatsink in all cases.

Just my experiences; your mileage may vary, etc......

Hope this is helpful.

Interestingly enough, gel-cell batteries are all but gone from the scene in the U.S.

Low/no maintenance batteries these days are "depleted electrolyte" or "glass-matt" varieties. I only know of one mfr. who still makes gelled electrolyte batteries, and he's in Germany.

The big problem with depleted or glass-matt batteries is that all have some plain old electrolyte (acid) in the cells, and although they are spillproof, and can be used in most any position, overcharging can (and WILL!) rupture the cells, and douse the area with acid. Yep - once the hatch ruptures, all bets are off as far as "spillproof" goes. Since these batteries have sealed cells, it is important to determine how much (little?) over-pressure will rupture them.

I've found many will rupture with as little as 2 PSI over-pressure. You can generate this amount of overpressure by connecting a very small receptacle wall-mount charger to a 2 AH battery, and charging for a weekend. This is of course over-charging the battery - more importantly, it is VITAL to use the mfr's recommended charge system!!! This will typically be a "constant-voltage" type charger - NOT the (much more common) "constant current" type.

Lastly, I have to agree with KD1YV - this weekend I had a 6 AH depleted electrolyte battery sitting on my back seat - the "zip-cord" wire I had connected to it (with a beral connector termination) aparently had a spot where the wire did not have adequate insulation between the two conductors (might have been damaged earlier, but it didn't show). While driving down the street, the entire passenger compartment filled with acrid white smoke - the wire had shorted, and only quick action on my wife's part saved the car from a real calamity. The cells were hot enough to start the wood case I'd placed around the cells smoldering! I shudder to think about these cells in a sealed, pressureized aircraft cabin! This battery setup had fuses in line too - the short happened very close to the terminals.

I apologize if this is a subject which has been sandbagged in
this or other newsgroups, but I just started thinking about
getting another HF rig and so haven't been following related threads.

I haven't been in the market for an HF rig in a long time, but
saw the IC-706 at HRO and thought maybe I should be. My last rig
was a TS430s and I liked its mobile and fine base station performance.

Can those who have used an ic 706 pass along comments, concerns,
etc? does it have enough features to be a good base station rig?
Is Icom a quality HF manufacturer who stands by its stuff? Are
there any compromises for it being able to operate in HF 50Megs,
and 2m?

Thanx in advance for your comments.

1806. Re: IC 706 2 meter RX WAY down, help!

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-30 00:00:00 UTC
From: "William O. Reichert" <billnihh@apci.net>
Message-ID: <4tk04h$6k4@queeg.apci.net>
Source record: 197014

My two meter sensitivity went down the tubes just today after two months of strictly mobile operation with no problems. Did not measure the sensitivity, but it was way down. Local repeater that is normally 60 over with the preamp off was about S8 with the preamp on.

Here is what I found: The PA board is where the initial receive signal comes in. Various things happen here, including the selection of the 2 meter band pass filter or the 60-200 (as ICOM calls it) band pass filter. I found L26 and L27 in the two meter band pass filter were loose. These are encapsulated surface mount inductors that apparently were improperly soldered to the PA board.

I managed to get them back on, but it wasn't easy. Parts density in that area is great. I probably should have taken it to work where I have access to surface mount repair equipment, but I managed to effect repairs with a 1/4" tipped soldering iron. I would not recommend this for just anybody.

Still with a little care and average dexterity I imagine most could do it. It is necessary to slip the power connector off the chassis and push it back out of the way as the components in question are under the power cabling. They are not labled on the board, so explaining where they are is a little tough (I had the advantage of having the service manual--it arrived Friday after a six week wait).

Orient the radio as follows: bottom up, with back panel to your right and power connect at the lower right. Look for the external speaker connector; just below the external speaker connector there is a two pin plug/jack that routes the cable for the internal speaker up to the top cover. Just to the left of this plug is L26, and just below it L27. To the left of the two chip inductors is a larger adjustable coil, L30. Using v-e-r-y little pressure with a small probe, see if they are loose. In my case, L26 was already flopping around by itself and L27 came loose with almost no encouragement. If coils aren't loose, then you have a different problem than mine.

If they are loose, a very small tip on about 15 watt iron is probably about right. Try to apply a little heat where you can see copper or solder at the edge of the chip inductors. The top of L26 is the hardest to get at.

There's just one thing that worries me. There are LOTS of chip components in the IC706 and if they are all soldered as well as these coils, I'm gonna be hurtin and so will a lot of other people. The next problem may not be so easy to find. After all, it was limited to 2 meter reception, so was fairly simple to find the problem.

If you are not an experienced repairer or builder, and don't want to void the warranty, best to sent it back to ICOM. I wasn't worried about the warranty as I voided (probably) mine the first day I owned the rig performing the "yellow wire" mod.

Good luck, hope this fixes you up.

I don't know where you get your information, but it is both uninformed and incorrect. The ABA Model Rules of Professional Conduct Sections 2.0-2.2 makes it quite clear that if two clients are adverse in an action, the lawyer cannot represent either, unless one gives the lawyer permission to represent the other.

>Conflict of interest means that he is breaching confidentiality or using
>knowledge of one client to benefit the other.

No, that's not what it means. It means that the lawyer cannot diligently represent one client without failing to diligenly represent the other. (My words, but that's the gist of it.)

>Just the suspicion of this
>can cause his clients to leave. Proof gets him disbarred. No wonder he is
>pissed off.

Wrong again. Disbarment is not always the sanction imposed on a lawyer who violates the rules. Sanctions usually are less severe, such as a public reprimand, or other punitive, non-disbarment stuff.

I am not familiar with the FT50R, but Yeasu likes to use solder pads
to set the rig up for different band plans & channel spacings. That
way they can sell the same radio in the US, Brittain, etc, with only
having to change a jumper or two. My guess is that these pads will
reconfigure the radio for different countries. (My FT207R brick HT
was this way. Never did figure out how to extend the RX/TX for MARS.)

I have a two year old Kenwood TH-78A dual band handheld for sale.
Asking $250. It has original rechargeable battery pack with an
additional alkaline battery pack, original manual. I have had it checked
out by kenwood and it puts out 3 watts on full power. It has a receive
range from 118 mhz to 178mhz and 438 - 450 mhz and transmit range from
144-148/ 438-450 mhz.
It has 3 power settings, 3 watts, .5 watt, and .02 watt. It is in very
good condition with original rubber duck antenna and ANLI-8 dual band
antenna and I will throw in a full size dual band RD-78 whip for it as
well. I also will include a car cigarette adapter power cord which will
allow the unit to run at 5watt output.

I will entertain any questions you may have about it.

Email me at BTCQ21A@prodigy.com

I would also warn that there are strick regulations in the USA on a passenger using a radio transmitter on a commercial aircraft. It is my understanding that not only do you need the permission of the pilot and airline but also approval from the FCC. Needless to say, you won't get that permission.

>
>thanks, Moritz DL5UH

I think Gary used the wrong term. It was not built with EMT conduit. That stuff is steel and it does not bend very well. The stressed dish was made with aluminum tubing. 1/2" diameter. Wall thickness was around 0.049". Comes in standard 12-foot lengths. Cost is a little over a dollar a foot. Aluminum will bend and take on a parabolic shape. You anchor the end of each tube to a center hub. At the far end you attach a non-conductive line and pull the tube toward the center focal point of the dish. This bends the tube into a near parabolic shape. Cover with chicken wire (For 432 MHz) and you have a simple dish. This design is in about every ARRL antenna book printed in the past few years. You will also find it in "The Satellite Experimenter's Handbook",second edition, by Martin Davidoff, K2UBC.

It's time to switch up from my Icom 24AT... I'm not impressed with the 24AT, this is the 2nd time back to the shop. 440 transmits but no wattage to speak of. Another $150.00 probably.

Is anyone not happy with Alinco? Don't care for this radio? would I be better off with the DJ-582T (only 50 bucks less]

Thanks ahead of time...

Rich

Problem solved!!!!!

I found with help from Yaesu tech on the phone that the cable was not making contact at the radio end.... The connector was slightly out of place. A little pressure re-seatted the connector and away I went....

If any one else has this problem. Try taking voltage readings from ground to the 8 or so pins on the radio and then at the control head end of the cable after it is connected. You will get voltage on some of the pins!!! The will match the test at the radio.

<reposting since first post was messed up, had replies/header information user@site.com.. agent.ini was fried.> Sorry!

Must Sell ASAP: (No reasonable offer refused):
(3) Uniden FPS910TS 900 trunked HT. 9 System, 9 group 'brick' radio (rather large, a tiny bit more than the BC1/200 HT). Comes with 2 brand new batteries, 3 older batteries, a SMC antenna (standard Uniden Mount), a gain BNC antenna (has BNC-SMC converter), a mag mount mobile antenna, 3 rapid chargers (not available anymore, hard to come by!!!) and 2 vinyl holster (no belt loop, just more for shipping/travel. $200/ each, or $475 for all 3. Invested much more into it. 2 currently programmed for TAC use.

(1) Johnson 9 channel 40?? (maybe 60) watt mobile. VHF. Was from Florida Sherriff or police which went to 800. Programmable by computer from Johnson Dealer. Must use external speaker (I can dig one out, standard 3.5mm plug), hand mike, and power cord included. GREAT radio. Scans, PL, everything. $250/bo.

(1)Yaesu FT40, 99 Channel radio. Includes tx/rx mod, tx and receives from 430 -484.This unit is LITERALLY the size of a pack of smokes, maybe a TINY bit deeper, but the same height and width. (Just add an antenna.) Does 99 channels PL _AND_ DPL, Keypad programmable, dual VFO, Dual watch, digital voice (record up to 20 seconds from the radio or by mike and either play back through speaker OR back on the air! Record you call and never say it again! Searches PL & DPL (yep, don't know the PL? Just hit a key, and it tells you! (I Can't find this in the manual, I think it;s a hidden trick.) (PLEASE don't ask how to do it, I was overrun by more questions on how to do it than offers to buy..)Comes with low power battery pack, charger, manual, and box. Barely used. Would prefer Bay Area (California) but will ship. $280/BO.

WTB: Icom U-16, must be in good condition. Make offer, or trade for one of the above??

WTB: Yaesu VX-10.. Make offer, trade for ALL of the above?

All prices plus shipping + COD. I am NOT a company, just a collector of stuff I no longer need. <GRIN>

ALL PRICES NEGOT.! I need to sell, so give me an offer!

eplatt@wco.com, or call me anytime at 415-939-1037.

1824. "Y" adapter

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-31 00:00:00 UTC
From: Scott Ryan <crtoy@fyiowa.infi.net>
Message-ID: <4tnm7o$ur6@nw101.infi.net>
Source record: 196812
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I'm looking to purchase or build a "Y" adapter that will allow me to connect the mono audio out (headphone, 1/8") from a scanner and a SW receiver to one stereo headset.

My thought is to connect the SW receiver to the left channel of the headset and the scanner to the right channel, so as to listen to both audio's at once. Will this create any negative effects (feedback, etc.) to the headset or the receivers?

1825. FS: Kenwood TH-79 Package

Marc:

Yes, it's definitely worth it. The receiver is the best I've ever had. Excellent filtering...especially in CW mode, with the SPAC filter.

Transmit's also gotten me very good audio reports. The radio is a blast to operate, and the RCP program for controlling the radio is lots of fun to play with. If you have specific questions about the 870, I'd be glad to answer them. I've got a friend who also has an 870 and he operates it with great success on PACTOR.

For the record, I've heard many simlar positive comments about the Yaesu ft-1000MP and ICOM 775DSP radios.

I've done this before and most times it seems to work quite well.
Sometimes it was two scanners, or SW and scanner, or whatever. Just a few
hints;
Make sure that the receiver playing in your left ear is physically
on your left and right on right. You'll have a tendency to turn
in the direction of the sound you hear.

Think about putting a momentary switch in a little box to open
either side, much easier than scrambling for the volume when you
want to listen to "one side" only. Locate these in the box
opposite the side they are wired to, that way you press the side
you want to hear and the other drops out.

Don't listen to static or hash for a long time, it's amazing how
deaf you become right after you take the headphones off.

I tend to use "ear-buds" since they let me hear more of the
ambient sounds around me. YMMV

Don't chew gum or walk while using this set-up, you could put your
eye out! :>

I guess this way you'll only have to spend half as much time to hear
everything you want. I did run into one individual who used to do this
but he was listen to four receivers and could keep up with our
conversation. As far as I know he's still doing it, buried in some
"magic-mountain" (tm) somewhere.

That's the same trouble that the makers of slick50 had with Dupont. Dupont didn't want to sell them teflon because they didn't agree with it's use in car engines. Slick 50 sued and won!

You cannot prevent someone from buying somthing based soley on what they might do with it.

I will admit that this thread stopped me from buying a used TS50 for $500. I changed my mind and bought a DX70....

Some military radio users do this sort of thing all the time, without
any problems. They also have a switch which enables them to transmit on
either of the nets they are monitoring.

Look out for the " CATCC V1.x" , You will find it on the QRZ! Ham
Radio CD-ROM from Wallnut Creek (Vol.5)
It's configurable for a lot of Rigs with all features
I use it on my FT-1000D and sometimes on my FT-767GX !

1840. Opinions on IC-Z1A and FT-50: a summary

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-31 00:00:00 UTC
From: ianj@pogo.wv.tek.com
Message-ID: <4to81o$enl@gazette.wv.tek.com>
Source record: 196828

Having received replies from two people in about a week and a half, I thought I'd condense what they said and post it back to the group.

I originally asked whether people had preferrences between the Icom Z1A and the Yaesu FT-50R, both of which were being considered by me. I am new to Amateur Radio, so I wanted to see what more experienced Amateurs had to say on this topic.

The two responses I got were helpful and informative. The first (from Jim Boritz, VE7YJB) suggested that the Z1A was probably a better choice, due to its superior features (notably 'true' dual-band operation with two separate receivers and standard CTCSS decode). The FT-50, in his opinion, is probably a fine radio, but isn't full-featured enough for him. He also mentioned that someone he knew disliked the FT-50 for being quite heavy (since you could get a 'true' dual-bander in the same weight class).

The second response was from Jerry B. Altzman, KE3ML. He suggested that I should stick with the radio that seemed less likely to break, since to perform basic operations, a great number of bells and whistles aren't necessary. He also suggested that no matter which radio I got, it's likely that I would just upgrade in the future, so the consideration 'should I get enough of a radio that I can grow into its features' becomes less important. This seems to indicate that the FT-50 is probably the better choice.

My final decision has been that I will get the FT-50. There are a number of reasons for this, which I will attempt to outline here. The most basic reason is that the FT-50 is a current model, while the Z1A is being phased out (hence its current low price). I am somewhat concerned that the Z1A is being phased out for a reason which should affect my choice. There is also the issue that I may not be able to *get* a Z1A should I decide on that rig.

The other major reason has to do with the audio output of both these radios. I have read reviews of the FT-50 which proclaim its audio to be among the best in the business, which sounds like a good recommendation to me. I have read comments in rec.radio.amateur.equipment suggesting that the Z1A suffers from poor-quality audio, partially due to its removable (and therefore very small) faceplate. Obviously the best test will be to go to the store and listen to them both before deciding on this factor.

I found some resources on the Web regarding both these radios, which may help anyone else looking for information. The two sites which proved most helpful were; Ham Radio Online (about the FT-50):

http://www.hamradio-online.com/1996/jun/ft50review.htm

and at Ham Radio Today (for information on the Z1A):

http://www.netlink.co.uk/users/hrt/magazine/issues/fullmag/review2.html

Both these sites provide good information on the respective radios, and
I would strongly recommend them to people looking for reviews.

My thanks to both Jim, VE7YJB and Jerry, KE3ML, for responding.

Exactly! I never bothered to upgrade my license class OR buy an HF
transceiver for over a decade because I was not in a position where I
could put up any HF antennas!

Even after I got into a house, the CC&R's in my neighborhood STILL
prevent me from doing things the easy way, but I can get away with a
lot more than from an apartment !

I've been looking endlessly for some cool amateur radio broadcasts (preferably live stuff) on the net. I realize the technology is still fairly expensive so it's hard for people to broadcast on RealAudio or Streamworks but I'm interested in hearing some stuff out there.

If you know of places where I can find this kind of live broadcast I'd really appreciate being pointed to it.

I've done countless searches and must be putting in the wrong key words.

Is anyone out there doing some amateur stuff or is it mostly the mainstream doing online live broadcasts?

Your help is appreciated

email to ao349@freenet.carleton.ca

1) You can use a ham radio (or anything else) in a private aircraft at the discretion of the pilot-in-command (PIC). Generally for VFR flights this is not a problem. For IFR flights the PIC will probably ask you to shut down while conducting the instrument approach (I would).

2) Gell Cell batteries are widely available still. Sonnenshine (sp?) of Germany makes the best ones I know of on the market. They will deteriorate after about three years of trickle charge. They are not cheap.

3) Any lead acid or Gell Cell has a pretty low internal resistance and will heat up pretty badly if shorted. That is the hazard with most battery packs. Be careful.

4) Private airplanes have Lead Acid batteries for starting the engine. They are vented, but they will not leak if hit by turbulence or unusual attitudes.

In article <31FF8CC9.6F95@fuwutai.lucent.com> Sheldon Darack <shel@fuwutai.lucent.com>
writes:
-Sounds fine. You need two mono plugs (one for each radio) and one stereo
-jack. Also two lengths of two conductor speaker wire. Connect the
-grounds together at the stereo jack. Audio from one mono plug goes to
-the stereo jack "tip". Audio from the other mono plug goes to the stereo
-jack "ring".

Just keep in mind that this will create a common ground connection between
the two radios. Usually it's not a problem, but may be in certain setups.

>

You didn't mention on what frequency your local repeater operates, but the 212 will transmit on all repeater frequencies in the amateur 2m (144-148 mHz) band. As shipped there is a cutoff frequency (145 something mHz if I remember) below which transmitting is disabled. This can be re-enabled through a series of key presses: it's in the manual, I believe.

Reminds me of a Navy instructor who when asked the same question about a Yagi, raised his eyebrows and dryly said " pretty good." 'Course the same guy,
a day or two before, enlightened us about the "1/4 wave ground plane" or the "Marconi whip" antenna. Seems Marconi had been working through a summer draught trying to prove a base fed 1/4 wave rod with it's insulated base stuck in the ground, would produce a nice 360 deg. toroidal radiation pattern. After a fruitless few days, Marconi threw up is hands and said "Aww piss on it". Well one of his grunts did just that and all of a sudden the antenna started working. And that's the honest to gosh beginning of all those little 1/4 wave whips you see on cars nowdays.

>
> http://198.213.26.193/beaumont/central/main.html

Select one of the PMS memories by pressing 01, 02, 03, or 04 followed by
the MR key. That should take you to the selected PMS memory and
automatically begin scanning. Or you can select one of the PMS memories
by using the tuning knob or up/dn arrows, press MR, then press and hold
the up or dn arrow until scanning starts.

Note that the limits you program into the PMS memories must be even
multiples of 100 KHz. In other words, 146.600 and 147.400 are acceptable,
but 146.610 and 147.390 are not. Same goes for UHF -- 442.000 and 445.000
are ok, 442.025 and 444.975 are not.

All of this Is in the manual, but not all of it is crystal clear!

Good Luck.

73, Jim, KC5OA

That was pretty well debunked as being a rumor (or a UL, as they say on
alt.folklore.urban) at the time, based partly on the author's attempt to
portray illiteracy. FWIW, some would claim that a dealer *can't* refuse to
sell to any person who isn't barred by law from buying the item in question
(unless the seller has reason to believe that the buyer will use the item
illegally).

1866. Kenwood TS450S 500Hz CW filter & service manual

Newsgroup: rec.radio.amateur.equipment
Date: 1996-07-31 00:00:00 UTC
From: Peter Orban <peter.orban@nrc.ca>
Message-ID: <31FFB6FD.41C6@nrc.ca>
Source record: 196854

A friend of mine would like to add a 500Hz 455KHz CW filter to his
TS450S radio. The OEM filter is quite pricy compared to a Collins
mechanical filter with the same bandwidth.
I would like to get in touch with someone who has a service manual for
the radio and could give some info on the second IF filter interface
and/or added a non OEM filter to his gear.

Thanks, Peter

I have been told there is a MP-100. That too sounds like a variation of
a RADIUS product. That is probably why our previous rep wasn't familiar
with it. He didn't deal much with Radius.

Thanks for the replies.

> as frequency was reduced. I got only 5 or ten watts on 30 MHz, and almost
> nothing on 160.
>
> I can not say if yours was the same.

What happened here was something strange with two IC-706:

I was listening on 32 Mhz some phones when I try to transmit on this band. The antenna is not for this band and I have a lot of SWR. As the radio is protected for high SWR it only allow up to 10W. On the VHF band the radio work fine, the output is 10W like in specification, but on HF bands now it only TX with 10W and no more... It is like if the SWR protect circuit has turn on continuously and now do not allow me to transmit with 100w on HF ! I have had the same problem with two IC-706 doing the same thing on 32 Mhz phone band...

There are switching diodes that control which bandpass filter
is selected. Check both the input and output bpf diodes.
Also, there is a control chip which selects each frequency
segment and sends a dc bias voltage to the above diodes
(forgot the chip number). I've seen both the diodes and the
chip go bad with a loss of a given spectrum segment.
High voltage on the antenna input (near lightning strike, static
discharge, another transmitter during field day :-), etc) may be
the cause.

Another possibility is a bad vco segment in the PLL or its
control circuitry - now things get complicated.....

Good luck,
73

it's a matter of getting what you pay for. If you wanted wide coverage by a more expensive radio. But if you want cheap, and you (meaning no particular person) didn't do his or her homework and bought strictly by price, then you got what you paid for.

BTW, if memory serves me correct, didn't icom make these for Radio Shack??

I had a similar problem with my FT-51R. After taking it apart to
resolder the center pin on the BNC (The usual problem) I discovered
that the BNC on the 51R does not have a soldered center pin. To fix
the problem, carefully take a pair of pliers and tighten the bnc
connector by twisting it, much like a bolt. It should snug right up.

From: bgudgel@eskimo.com
Message-ID: <DvG44J.3E9@eskimo.com>
Source record: 196678

Well, I went through all eight permutations while I had it open.

Jumpers (from left to right)
C=open (soldered)
O=open (no solder)

C O O this is the way mine was shipped -- extended receive
O O O extended transmit (mars modification)
O C O looks like the European mode RX 140 - 174 no extended transmit
Also, no 800 MHZ or 76 Mhz RX
O C C same as O O O
O O C RX 108 MHz - 174 MHz and 400 MHz - 470 MHZ no extended transmit
C O C same as O O C
C C C 144 MHz - 148 MHz and 430 MHZ - 450 MHz no extended
C C O some kind of limited mode again (I didn't detail my notes)

Basically, O O O is what you want. All other combinations appeared to be
something less than full featured. This is as far as I could tell with MY
FT-50R anyway. Please let me know if anybody finds any important
mistakes here. Thanks

>> Of course, what could anyone expect? It's Radio Shack...

OK, you've tried a shot at bashing RS and think you have an argument because it doesn't cover the whole band out of the box.

The RS 212 out of the box starts transmitting at 144.600, with a good reason. Remember RS had HAMS help design their VHF gear, to make it more user friendly to the entire HAM population, that is the reason for such a tight front end on the 202, these HAMs wanted an HT that was intermod free, and that is what the 202 is, if you want a scanner buy a scanner. Now back to the 212.

Do you pay attention to the ARRL band plans? Have you ever heard that there were band plans

144 - 148 MHz

144.00 - 144.05 EME (CW)
144.05 - 144.10 General CW and Weak signal
144.10 - 144.20 EME and Weak Signal SSB
144.20 National Calling Frequency (CW, SSB)
144.20 - 144.275 General SSB operation
144.275- 144.30 Propagation Beacons
144.30 - 144.50 New Oscar Subband
144.50 - 144.60 Linear translator inputs
144.60 - 144.90 FM repeater Inputs
144.90 - 145.10 FM simplex (widely used for packet)
154.10 - 145.20 Linear translator outputs
145.20 - 145.50 FM repeater outputs
145.50 - 145.80 Misc and Expermental modes
145.80 - 146.00 Oscar subband
146.01 - 146.40 FM repeater inputs
146.415- 146.595 Simplex
146.61 - 147.39 FM repeater outputs
147.42 - 147.595 Simplex
147.60 - 147.99 FM repeater inputs

Notice the Frequencies or channels if you will, between 144.000 and 144.600. Do you really want an out of the box 45 watt FM only rig to transmit in these channels? I'm sure the guys working meteor scatter or weak signal stuff are happy that the RS rig is not going to throw a 45 watt FM signal on top of them because someone punched the wrong frequency up.

If you have a real reason to use this rig on those frequencies I would hope you would have read the manual.

You can talk about your Yeaconwood's all you want, but RS has one advantage over all of those, a real distribution channel. I can drive less than an hour almost anywhere in the country and be at a radio shack store that probably has the radios, and can get them overnight if not. I can get to 4 RS stores in less than 15 minutes where I live, and it is over an hour to a HAM store, which has a very limited inventory and you can never get the attention of the salesman because he is busy talking to all his ham buddies that come in every day to visit.

Bash RS all you want, but I have the 10m rig, three 2m HT's and the 212 and am very happy with all of them, and have not had a bit of problem with any of them. I am not associated with RS in any way, but pleased with there Ham products, which are not built by ICOM.

Maybe now that Kenwood is selling in truck stops it would be easier to get a rig, but Kenwood VHF gear is no where near the quality of their HF.

King is still around. They can be reached at (914) 793-5000. Give them a
call and ask for a distributer near you. You could buy crimp tool for
their connector from other suppliers and save some money. Here in
California Pasternack Enterprises sells crimp on UHF connectors for RG58
and RG8 cable and also crimp tools(not a King's connector). The phone
number is (714) 261-1920. Another possible source would be RF Connectors
800 233-1728. Good hunting.

From: Sheldon Darack <shel@fuwutai.lucent.com>
Message-ID: <3200DF40.3879@fuwutai.lucent.com>
Source record: 196688

Raymond: the micro 2E is the European version of the micro 2A,
which means it has tone burst instead of ctcss.
It normally transmits 140-149.995 and recvs 137 - 174 MHz.
To change the transmit range requires changing the diode matrix.
There's no way to change it via software. I don't know how to limit
the rcv range. You can reset the uP to the original state (all memories
lost) by switching the offset on back to simplex and turning the pwr
switch on while holding down the lamp button. The same procedure allows
you to reprogram the offset if you have the offset in either + or -. To
store the new offset and get into normal operation, press the small
"check" button which normally switches the recv frequency to the offset.

>Ben WD4MNI AM&FM&TV

You probably do not want to increase a diode size, as it could also be considered a fuse. Might be designed to blow before something else more expensive to replace. If it is D6, you can install a diode limiter modification where another MI-809 diode is installed in reverse direction across the original one that goes to ground just off the cathode of D6 Sorry do not have diode numbers at hand. This is intended to keep voltages at 0.6 volts and D6 alive and well. ALSO seperate your antennas if you have not done so already.

1898. FS: AC to DC Regulated Power Supply

Newsgroup: rec.radio.amateur.equipment
Date: 1996-08-01 00:00:00 UTC
From: aak@olympus.net
Message-ID: <aak-0108961100290001@papm016.olympus.net>
Source record: 196690
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,pnw.forsale,olympus.forsale,seattle.forsale.misc,sci.electronics.equipment,sci.electronics.components

I have the following for sale:

A Tripp-Lite precision regulated DC power supply. It converts 117 Volt AC power into regulated 13.8 Volt DC power.

The specifications on it say:

Precision Regulated DC Power Supply Model: PR-7 b
Output: 13.8 Volt DC 7 Amp
Input: 117 Volt AC 60 Hz
Fuse Protected
Low Ripple Fully Regulated
Electronic Overload Protection with an Instant Automatic Reset
---
It is brand new, never been used, and still in the original box. It comes with the original instructions. This is good for ham radio operators or any others that operate equipment that requires the use of regulated DC power from an AC power source. Delivered right to your door. Retails for 69.95. Sell for $50. Reply by e-mail.

Thanks
Tony Korolis

Have you EVER heard or used a linear translator? I'm talking earth
based, now... not something up on a satellite. I didn't think so.
We supposedly had one here in Northern California but I've never
talked with anyone who has / had used it.

Now, rather than waste spectrum that is set aside for unused,
non-existent linear translators, Northern California has seen
fit to use the above frequencies for inputs to FM repeaters. Five
of these repeaters are within range of me. They are all
coordinated with the local coordinator.

Why should an amateur have to jump through hoops in order to use
his radio on the frequencies s/he desires right out of the box?
Perhaps these "hams" who helped design the radio didn't design it
correctly?

> Notice the Frequencies or channels if you will, between 144.000 and

I don't really need a company protecting me from myself and I'm sure
that others feel the same. I'm perfectly capable of conducting myself
within the guidelines of "good amateur practice." I resent a company
implying that I wouldn't.

> If you have a real reason to use this rig on those frequencies I would
> hope you would have read the manual.

I would hope that ANYONE would read the manual for their radio. I
believe that I've demonstrated the reason for using the radio on those
frequencies above...

Now we get to the root of how easily your button was pushed, Glenn.
I can see that if someone doesn't think highly of the company you've
chosen to supply a majority of your amateur gear that you take it as
a personal insult. Well, that is your problem, I guess. It would seem
that you have some doubts about your equipment, otherwise you might not
have to try so hard to reinforce your confidence in it. Too bad...

Of course, the other reason might be because I'm picking on the
hometown boys, seeing as how Radio Shack is based in the same state
as you.

Hope you get over your complex soon--
Ken

Back in 1993 I purchased an AEA RL-1 controller. It was frought with many bugs, so many in fact that after expending around $500 and many many hours, I gave up on it with the idea that someday I would either dis-assemble their code and try and stomp the bugs or re-write the whole program. I still haven't gotten around to it. Back then I had some correspondence with several others who had similar experiences and ideas. I am wondering if anyone has proceeded any further than I have.

I did chat with AEA today, and as far as we could tell they haven't addressed any of the problems I had in their updates.

Please send me a note if you are interested or if you know anyone who might be or anyone who has worked on this.

Thanks,

Rob KL7NA/W7

Hi, Are you looking for a First HF Rig or a Backup Rig? I have the workhorse of kenwood available at this time.
The Kenwood TS-520s HF Multi-Band Station; Installed Options: External VFO for working DX/Split Frequency QSOs, Narrow CW Filter (useful for cutting out unwanted interferance), DC-DC Converter which allows EMERGENCY operation on +12Vdc, AC-Cord which allows Normal operation, External Speaker which enables you to hear on your "good" side, and Desk Mike to really get your signal out!. Operating and Maintenance Manuals Included. Rig was used this year at field day as our PRIMARY CW STATION with EXCELLANT RESULTS!!! The only reason I am parting with this setup is because I recently recieved a TS-140s and have to pay the XYL back :-) .

Hi Gregg-

One of the big ham stores has `em, but I can't remember which one for sure. Several may.

A couple of years ago I ordered several from either AES or Universal Radio......sorry I can't remember which it was. They were not expensive. A good thing to have several of on hand..... Fortunately for me, it works on the old Collins gear too.

I second that. The guy that tell people to cut D12 is doing so to be
funny. It is not real funny to go cutting in your radio when another ham
radio operator malisiously gives wrong information. Do not listen to
this guy when it comes to mods.

California in spite of what they think is not the whole United States.
If you want to use these frequencies locally fine, but I still stand by
my statement that I think the HAM community as a whole benefits from
the RS design

>
>Why should an amateur have to jump through hoops in order to use
>his radio on the frequencies s/he desires right out of the box?

Jump through hoops, get real, this is a function command entered from
the keypad, no need to open the radio, which seems to be the delight of
every Yeacomwood. There are many post is how do I modify *****.

You've demonstrated your use and a few area's in California, the
command to add the frequency a simple one time command. So I think the
users who need the frequencies can do that much.

>chosen to supply a majority of your amateur gear that you take it as

>a personal insult. Well, that is your problem, I guess. It would
seem
>that you have some doubts about your equipment, otherwise you might
not

The vhf stuff is not the majority of my gear. My Collins, Drake, and Ten-Tec is the majority of the gear I own. I appologize to the HAMs who do the real VHF stuff, the EME, low power, SSB, satellite, but I consider VHF FM to be mostly appliance stuff and not worthy of spending much money on. My goal is to talk to other hams on the local repeaters. The RS HT's do that better than almost any other because of the intermod rejection, I don't know what more you could want in an HT unless it be size, but that is not an issue to me. The repeaters are a wonderful technology but for the actual end users machines it doesn't require much. If you want to stroke your own ego buy buying a whole lot more machine than is required to do the job, then so be it, it is your decision.

When somebody can show me a real reason to spend more money for VHF FM, then I will, but I see most of the more expensive rigs as just an ego boost for the owners. I purchase items to get the job done, if they do that job, I am satisfied. I don't tie my self worth to anything I own, if you do that, then the material things just end up owning you.

I guess my main question is: Did the poster who complained read the manual?

Have you personally owned and used any of the Radio Shack gear, I have owned some older Icom stuff, was OK, but for just plain usable gear I have no problem with the Radio Shack stuff. It does as advertised at a reasonable price, and is available all over the US.

>have to try so hard to reinforce your confidence in it. Too bad...
>
>Of course, the other reason might be because I'm picking on the
>hometown boys, seeing as how Radio Shack is based in the same state
>as you.

Buying from a US company, and Texas at that, it really hadn't entered my mind, sounds OK though. I did buy TEN-TEC for that reason though, it just didn't cross my mind on the cheap VHF stuff.

>
>Hope you get over your complex soon--
>Ken
>--

I hope you find happiness in your things and allow your ego to be stroked by buying overpriced items to do mundane tasks like VHF FM.

It is almost certainly a bad trimmer cap in one of the PLL circuits. It is a
very common problem with IC-735's. Dave probably tweeked the trimmer
and it worked (only for a while though)
It is best to replace ALL of the trimmers in the different PLL circuits to
eliminate the problem forever.
The original problem was that certain lots of these trimmers are bad.

Source record: 196712

I've got the RH-1 rubber protector, the soft case, and I even bought The Pouch. But I'm still not satisfied...

I'm one of those people who's constantly tinkering with his HT. It's on and off the belt constantly. The soft case is sitting in a drawer. I've removed the belt clip from the battery, as it's too difficult to deal with, and seems a bit too flimsy. I do like the RH-1 protector.

I'm looking for a case that holds the radio (preferably in the RH-1) snugly to my body. The Pouch is a pain. The radio feels sloppy in it, and the belt loop thingy (Fastex connector) doesn't allow me to snug the radio up.

I notice that Yaesu makes a commercial version of this radio, so I'm hoping that either they'll start making a decent case for it, or a third party manufacturer will. The clip holster that the Visar uses would be ideal, but the size is wrong. A cordura or leather case with either a D-swivel or belt loop would be ideal.

Anyone have further suggestions?

From: Brian Gould <rmedic@frii.com>
Message-ID: <32013FE9.7A60@frii.com>
Source record: 196722

Most of the rubber parts have either fallen off or been "removed" from my FT50R. (TX switch, Program jack etc.)

I have replacemnt parts, but my question is, How do I get the radio apart to replace them? I've removed the battery, vol/select knob & screws for the face piece etc, but there dosen't seem to be any other screws holding this thing together. I notice some tabs along the metal frame of the radio, but I'm not sure If I need to somehow spread them apart to get the "guts" of the radio out or if I'm missing something else? I certainly don't want to trash this thing getting it apart!

Any help?

From: jgrow@vir.com
Message-ID: <jgrow.7.000E199A@vir.com>
Source record: 196724

Hello to all, I have a very near mint R7000 with cellular, no modifications were done, this is how I bought it from the factory. I also have the 12 volt cable option. THis radio was never used mobile. I also have the ATV unit for this radio. I want to sell the complete radio as a package. I have all the manuals. I also have the 25 to 1300 Mhz discone antenna. The complete package will go for $ 1575.00 plus shipping.
Thank you
John

Jeff
I did do what you are talking about. I tapped in where the S-meter adj.
was in a 2970 (SAME) 2950 I worked very well. I used a beter from an old
Heathkit reciever. Sorry I don't have the point where I put it thats
been about 3 years ago.

> source, not stealing them from the transmissions..... Just a thought.
>
>
Here are my thoughts in reply...

Sounds like you have a guilty conscience to me; is stealing codes the only use you can think of for this feature?

If you ask this question strickly from a free market standpoint, then you might have a legitimate argument that it is not a "feature" that anyone would pay for (I have this "feature" on my radio because I wanted CTCSS decode). If this is the case, I take exception with your phrase "should even be on a radio?" It only leads to the moral argument which I will answer with "why shouldn't it be?" As with so many other things, the radio with this feature does not have any morality attached to it. It is the user who is the moral agent and who must exercise self control. The only appropriate answer, other than this, is "it should not be there because it makes the radio cost more and people do not want to pay for features they do not need." This, of course, it a purely economic argument and is amoral.

How about questions like "why should those people even be publishing that newspaper, anyway?" or "why should that church even be in our town, anyway?" or "what do you even need those kinds of guns for, anyway?"? You may or may not think these are legitimate questions for society to ask, but I prefer to let then be answered with the voice of liberty as opposed to the iron fist of government.

When are people going to grow up and realize that we cannot continually ask manufacturers (or the government) to make sure nobody does anything wrong?

This is my first reply to a news group. What does this have to do with DX. I have been reading the rec.radio.amateur.dx stuff for about a week now and notice little DX info is reported here. Is this intended to be a source for DX? If not let me know so I can stop wasting my time. de Bernie, WR3E.

>WHY??
I had a TH-79A, sold it because I didn't use that much of it, and even with the menu's it was hard to use. I now have the FT-50R, it can be modified, I can program it on the computer, it is smaller, it is a scanner, it sounds better, it can put out 7 wats! This is the best HT I have ever seen!
